SAFETY PRECAUTIONS AND ELECTRICAL REQUIREMENTS

CAUTION: READ THIS SAFETY GUIDE BEFORE YOU BEGIN INSTALLATION OR OPERATION. FAILURE TO COMPLY WITH SAFETY INSTRUCTIONS COULD RESULT IN BODILY INJURY OR EQUIPMENT DAMAGE.

HAZARDOUS VOLAGES: CONTACT MAY CAUSE ELECTRIC SHOCK OR BURN. TURN OFF UNIT BEFORE SERVICING.

WARNING: TO REDUCE THE RISK OF FIRE OR ELECTRICAL SHOCK, DO NOT EXPOSE THIS APPLIANCE TO RAIN OR OTHER MOISTURE.

CAUTION: TO REDUCE THE RISK OF ELECTRICAL SHOCK, DO NOT REMOVE COVER. NO USER-SERVICEABLE PARTS INSIDE. REFER SERVICING TO QUALIFIED SERVICE PERSONNEL.

WARNING: DO NOT PERMIT FINGERS TO TOUCH THE TERMINALS OF PLUGS WHEN INSTALLING OR REMOVING THE PLUG TO OR FROM THE OUTLET.

WARNING: IF NOT PROPERLY GROUNDED THE MOTU 896mk3 COULD CAUSE AN ELECTRICAL SHOCK.

The MOTU 896mk3 is equipped with a three-conductor cord and grounding type plug which has a grounding prong, approved by Underwriters' Laboratories and the Canadian Standards Association. This plug requires a mating three-conductor grounded outlet as shown in Figure A below. If the outlet you are planning to use for the MOTU 896mk3 is of the two prong type, DO NOT REMOVE OR ALTER THE GROUNDING PRONG IN ANY MANNER. Use an adapter as shown below and always connect the grounding lug to a known ground. It is recommended that you have a qualified electrician replace the two-prong outlet with a properly grounded three-prong outlet. An adapter as illustrated below in Figure B is available for connecting plugs to two-prong receptacles.

IMPORTANT SAFEGUARDS

1. Read these instructions. All the safety and operating instructions should be read before operating the 896mk3.
2. Keep these instructions. These safety instructions and the 896mk3 owner's manual should be retained for future reference.
3. Heed all warnings. All warnings on the 896mk3 and in the owner's manual should be adhered to.
4. Follow all instructions. All operating and use instructions should be followed.
5. Do not use the 896mk3 near water.
6. Cleaning - Unplug the 896mk3 from the computer and clean only with a dry cloth. Do not use liquid or aerosol cleaners.
7. Ventilation - Do not block any ventilation openings. Install in accordance with the manufacturer's instructions.
8. Heat - Do not install the 896mk3 near any heat sources such as radiators, heat registers, stoves, or another apparatus (including an amplifier) that produces heat.
9. Overloading - Do not overload wall outlets and extension cords as this can result in a risk of fire or electrical shock.
10. Grounding - Do not defeat the safety purpose of the polarized or grounding-type plug. A grounding-type plug has two blades and a third grounding prong. The wide blade or the third prong are provided for your safety. If the provided plug does not fit into your outlet, consult and electrician for replacement of the obsolete outlet.
11. Power switch - Install the 896mk3 so that the power switch can be accessed and operated at all times.
12. Power cord - Protect the 896mk3 power cord from being walked on or pinched by items placed upon or against them. Pay particular attention to cords and plugs, convenience receptacles, and the point where they exit from the unit.
13. Disconnect - The main plug is considered to be the disconnect device for the 896mk3 and shall remain readily operable.
14. Accessories - Only use attachments/accessories specified by the manufacturer.
15. Placement - Use only with the cart, stand, tripod, bracket or table specified by the manufacturer, or sold with the 896mk3. When a cart is used, use caution when moving the cart/apparatus combination to avoid injury from tip-over.
16. Surge protection - Unplug the 896mk3 during lightning storms or when unused for long periods of time.
17. Servicing - Refer all servicing to qualified service personnel. Servicing is required if the 896mk3 has been exposed to rain or moisture, does not operate normally, or has been dropped.
18. Power Sources - Refer to the manufacturer's operating instructions for power requirements. Be advised that different opening voltages may require the use of a different line cord and/or attachment plug.
19. Installation - Do not install the 896mk3 in an unventilated rack, or directly above heat-producing equipment such as power amplifiers. Observe the maximum ambient operating temperature listed below.
20. Power amplifiers - Never attach audio power amplifier outputs directly to any of the unit's connectors.
21. Replacement Parts - When replacement parts are required, be sure that the service technician has used replacement parts specified by the manufacturer or have the same characteristics as the original part. Unauthorized substitutions may result in fire, electric shock or other hazards.
22. Safety Check - Upon completion of any service or repairs to this MOTU 896mk3, ask the service technician to perform safety checks to determine that the product is in safe operating conditions.

ENVIRONMENT

Operating Temperature: 10°C to 40°C (50°F to 104°F)

TO REDUCE THE RISK OF ELECTRICAL SHOCK OR FIRE

Do not handle the power cord with wet hands. Do not pull on the power cord when disconnecting it from an AC wall outlet. Grasp it by the plug. Do not expose this apparatus to rain or moisture. Do not place objects containing liquids on it.

AC INPUT

100 - 240 VAC ± 5% / 60 Hz ± 25 Watts.

About the Mark of the Unicorn License Agreement and Limited Warranty on Software

TO PERSONS WHO PURCHASE OR USE THIS PRODUCT: carefully read all the terms and conditions of the “click-wrap” license agreement presented to you when you install the software. Using the software or this documentation indicates your acceptance of the terms and conditions of that license agreement.

Mark of the Unicorn, Inc. ("MOTU") owns both this program and its documentation. Both the program and the documentation are protected under applicable copyright, trademark, and trade-secret laws. Your right to use the program and the documentation are limited to the terms and conditions described in the license agreement.

Reminder of the terms of your license

This summary is not your license agreement, just a reminder of its terms. The actual license agreement is a contract, and clicking "Accept" binds you and MOTU to all its terms and conditions. In the event anything contained in this summary is incomplete or in conflict with the actual click-wrap license agreement, the terms of the click-wrap agreement prevail.

YOU MAY: (a) use the enclosed program on a single computer; (b) physically transfer the program from one computer to another provided that the program is used on only one computer at a time and that you remove any copies of the program from the computer from which the program is being transferred; (c) make copies of the program solely for backup purposes. You must reproduce and include the copyright notice on a label on any backup copy.

YOU MAY NOT: (a) distribute copies of the program or the documentation to others; (b) rent, lease or grant sublicenses or other rights to the program; (c) provide use of the program in a computer service business, network, time-sharing, multiple CPU or multiple user arrangement without the prior written consent of MOTU; (d) translate, adapt, reverse engineer, decompile, disassemble, or otherwise alter the program or related documentation without the prior written consent of MOTU.

MOTU warrants to the original licensee that the disk(s) on which the program is recorded be free from defects in materials and workmanship under normal use for a period of ninety (90) days from the date of purchase as evidenced by a copy of your receipt. If failure of the disk has resulted from accident, abuse or misapplication of the product, then MOTU shall have no responsibility to replace the disk(s) under this Limited Warranty.

THIS LIMITED WARRANTY AND RIGHT OF REPLACEMENT IS IN LIEU OF AND YOU HEREBY WAIVE, ANY AND ALL OTHER WARRANTIES, BOTH EXPRESS AND IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE LIABILITY OF MOTU PURSUANT TO THIS LIMITED WARRANTY SHALL BE LIMITED TO THE REPLACEMENT OF THE DEFECTIVE DISK(S), AND IN NO EVENT SHALL MOTU OR ITS SUPPLIERS, LICENSORS, OR AFFILIATES BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, INCLUDING BUT NOT LIMITED TO LOSS OF USE, LOSS OF PROFITS, LOSS OF DATA OR DATA BEING RENDERED INACCURATE, OR LOSSES SUSTAINED BY THIRD PARTIES EVEN IF MOTU HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS WHICH MAY VARY FROM STATE TO STATE. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

Update Policy

In order to be eligible to obtain updates of the program, you must complete and return the attached Mark of the Unicorn Purchaser Registration Card to MOTU.

Limited Warranty on Hardware

Mark of the Unicorn, Inc. and S&S Research ("MOTU/S&S") warrant this equipment against defects in materials and workmanship for a period of TWO (2) YEARS from the date of original retail purchase. This warranty applies only to hardware products; MOTU software is licensed and warranted pursuant to separate written statements.

If you discover a defect, first write or call Mark of the Unicorn at (617) 576-2760 to obtain a Return Merchandise Authorization Number. No service will be performed on any product returned without prior authorization. MOTU will, at its option, repair or replace the product at no charge to you, provided you return it during the warranty period, with transportation charges prepaid, to Mark of the Unicorn, Inc., 1280 Massachusetts Avenue, MA 02138. You must use the product's original packing material for in shipment, and insure the shipment for the value of the product. Please include your name, address, telephone number, a description of the problem, and the original, dated bill of sale with the returned unit and print the Return Merchandise Authorization Number on the outside of the box below the shipping address.

This warranty does not apply if the equipment has been damaged by accident, abuse, misuse, or misapplication; has been modified without the written permission of MOTU, or if the product serial number has been removed or defaced.

ALL IMPLIED WARRANTIES, INCLUDING IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED IN DURATION TO TWO (2) YEARS FROM THE DATE OF THE ORIGINAL RETAIL PURCHASE OF THIS PRODUCT.

THE WARRANTY AND REMEDIES SET FORTH ABOVE ARE EXCLUSIVE AND IN LIEU OF ALL OTHERS, ORAL OR WRITTEN, EXPRESS OR IMPLIED. NO MOTU/S&S dealer, agent, or employee is authorized to make any modification, extension, or addition to this warranty.

MOTU/S&S ARE NOT RESPONSIBLE FOR SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES RESULTING FROM ANY BREACH OF WARRANTY OR UNDER ANY LEGAL THEORY, INCLUDING LOST PROFITS, DOWNTIME, GOODWILL, DAMAGE OR REPLACEMENT OF EQUIPMENT AND PROPERTY AND COST OF REPROGRAMMING, OR REPRODUCING ANY PROGRAM OR DATA STORED IN OR USED WITH MOTU/S&S PRODUCTS.

Some states do not allow the exclusion or limitation of implied warranties or liability for incidental or consequential damages, so the above limitation or exclusion may not apply to you. This warranty gives you specific legal rights, and you may have other rights which vary from state to state.

This equipment has been type tested and found to comply with the limits for a class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference to a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause interference to radio or television equipment reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by any one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Plug the equipment into an outlet on a circuit different from that to which the receiver is connected.

If necessary, you can consult a dealer or experienced radio/television technician for additional assistance.

PLEASE NOTE: only equipment certified to comply with Class B (computer) radio/microwave and terminal, printer, etc.) should be attached to this equipment, and must have shielded interface cables in order to comply with the Class B FCC limits on RF emissions.

WARNING: changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.
Part 1

Getting Started
Quick Reference: 896mk3 Front Panel

1. These 10-segment level meters are dedicated to the 896mk3's eight analog inputs. The top red 'HOLD' LED illuminates when the signal reaches full scale—for even just one input. With V-Limit, the LED scale goes up to +12 dB and clips when the input signal goes over +12 dB.

2. This bank of level meters can be programmed to display any input or output bank: analog, optical (ADAT or TOSLINK), or "digital" (AES/EBU and S/PDIF). Use MOTU Audio Setup or the 896mk3's front panel to choose which bank you'd like to view with these meters. The LEDs to the right show which bank you are currently monitoring.

3. The light that is illuminated here tells you which bank you are monitoring with the programmable meter bank to the left.

4. These meters display the level for the 896mk3's main outs.

5. This section controls the 896mk3's built-in CueMix FX mixer and effects. There are eight stereo mix busses: each bus mixes all inputs (or any subset you wish) to a stereo mix bus. Push the CHANNEL knob repeatedly to cycle among the four main sections of the mixer: mix busses, inputs, outputs and the reverb module. Push the PARAM knob to enter the SETUP menu, which provides global 896mk3 settings, such as the global sample rate, etc.

6. The CLOCK LEDs indicate the global sample rate at which the MOTU 896mk3 is operating. Use MOTU Audio Setup to set the sample rate or to choose an external clock source, from 44.1/48 kHz to 96 kHz. If you are using an external clock, such as ADAT, but there is no clock signal currently being detected, these lights will flash.

7. FireWire and USB are "plug-and-play" protocols. That means that you can turn off the MOTU 896mk3 and turn it back on (or even unplug it) without restarting your computer.

8. Use this knob to choose which audio bank you are viewing with the programmable meters (2).

9. Push the CHANNEL knob repeatedly to cycle among the four main sections of the mixer: mix busses, inputs, outputs and the reverb module. Push the PARAM knob to enter the SETUP menu, which provides global 896mk3 settings, such as the global sample rate, etc.

10. Connect standard headphones here for hands-free punch-in and punch-out during recording. For details about how to set this up, see "Enable Pedal" on page 47.

11. From the factory, the PHONES jack is a discrete output (at 44.1/48 kHz). It defaults to mirroring the main outs. As the primary phone jack, it has its own dedicated volume knob.

12. The phone jack labeled (MAIN OUT) is a standard quarter-inch stereo headphone jack. Its output is hard-wired to mirror the XLR main outs on the rear panel. From the factory, this jack can be set to mirror group 2, the "Main Out" on the rear panel. To change the mirror group, push a fourth time to return to the previous volume in the LCD display; push a third time to return to the previous menu. If this jack has been programmed to mirror group 2, the LED to the left is illuminated.

13. These mic inputs are also equipped with the 896mk3's V-Limit™ hardware limiter, which provides an additional +12 dB of headroom above zero with no clipping or digital distortion. See "Mic/guitar inputs meters with V-Limit™ compressor" on page 42 for details.
Quick Reference: 896mk3 Rear Panel

1. These AES/EBU connectors can handle any supported sample rate up to 96 kHz, and they are also equipped with a sample rate converter so you can input or output at a different rate than the 896mk3. For details, see “Syncing AES/EBU devices” on page 30. At the 4x sample rates (176.4 and 192 kHz), AES/EBU is disabled.

2. These two XLR jacks serve as the MOTU 896mk3’s main analog outputs. You can connect them to a set of powered studio monitors and then control the volume from the front panel MASTER VOL knob. These jacks are always mirrored by the MAIN OUT headphone jack on the front panel.

To hear disk tracks in your audio software on these main outs, assign the disk tracks (and master fader) to these main outs. Also make sure the Main Out Assign option is set to Main Out 1-2. See “Main Out Assign” on page 45. You can also use CueMix FX to monitor live 896mk3 inputs here as well.

3. The 896mk3’s eight analog outputs are XLR connectors referenced to +19 dBU. They are equipped with 24-bit D/A converters capable of 192 kHz.

4. These XLR/TRS combo jacks accept either a mic cable or a quarter-inch cable. The XLR jack is equipped with a mic preamp. 48V phantom power and 20 dB pad can be applied via the trim knob on the front panel. The trim knob provides 53 dB of gain. The quarter-inch jack can accept a guitar or +10/-4 dB line level input. When connecting a line level input, be sure to turn off phantom power first, and engage the -20 dB pad.

5. Connect the 896mk3 to the computer here via either FireWire or USB2, using the standard 1394 FireWire B or USB cable provided with your MOTU 896mk3. If you use FireWire, you can use the extra FireWire port to daisy-chain up to four MOTU FireWire audio interfaces to a single FireWire bus, or to connect other FireWire devices. For details, see “Connecting multiple MOTU FireWire interfaces” on page 35.

6. These optical digital I/O connectors can be connected to an ADAT-compatible “lightpipe” device (such as a digital mixer) or to a S/PDIF optical (“TOSLINK”) compatible device, such as an effects processor or DAT machine. Be sure to set the format in the MOTU Audio Setup software (or using the front panel LCD). See “Optical input/output” on page 45 for details. ADAT optical supplies eight channels of 24-bit digital I/O per bank (4 channels per bank at 96 kHz). TOSLINK is stereo at sample rates up to 96 kHz.

One special note: you can choose independent formats for each bank, A and B, as well as IN and OUT within each bank. For example, you could choose ADAT for the optical A IN (for eight channels of input from your digital mixer) and stereo TOSLINK for the optical A OUT (for, say, your DAT machine).

7. These jacks provide stereo, 24-bit S/PDIF digital input and output at all supported sample rates (up to 96 kHz).

8. Use the word clock input and output for digital transfers with devices that cannot slave to the clock supplied by their digital I/O connection with the 896mk3.

9. The 896mk3 is equipped with an auto-switching international power supply.
Quick Reference: MOTU Audio Setup

Determines the clock source for your 896mk3. If you're just using the analog ins and outs, set this to 'Internal'. The other settings are for digital transfers via AES/EBU, S/PDIF or optical ports, or for slaving the 896mk3 to word clock.

This menu lets you choose what you will hear from the PHONES jack. To mirror the main outs, choose Main Out 1-2. Or you can choose one of the other output pairs to hear the phones as their own independent output. The phones must mirror any other available output pair.

Provides several options for the 896mk3's AES/EBU sample rate conversion. See, "Syncing AES/EBU devices" on page 30.

The 896mk3 driver provides a stereo return back to the computer. This return feeds the signal on any 896mk3 output pair directly back to the computer, where you can record, process, monitor or otherwise use it. This is a great way to “bounce” full mixes, complete with live audio routed through the 896mk3 only, back into the computer.

Click the General tab to access these settings.

Check this option if you would like the MOTU Audio Setup icon to appear in the application dock as soon as a MOTU interface is detected (switched on, plugged in, etc.)

This button opens another dialog that lets you assign your own customized names to each 896mk3 input and output. For example, if you have a lead vocal mic plugged into input 1, you could name it "Lead Vox".

If you have a foot switch connected to the 896mk3, these settings let you map the foot switch to any computer keyboard key for both the up and down position. For details about how to set this up, see "Enable Pedal" on page 47.

Click the tabs to access general MOTU interface settings or settings specific to the 896mk3 (or other connected interface).

Choose the global sample rate for the system here.

Specifies the stereo input and output pair when the 896mk3 is chosen for Mac OS X audio I/O.

Each optical bank can be configured independently: ADAT or TOSLINK. Disable them when not in use to conserve DSP and FireWire/USB bus bandwidth.

Choose the output pair you would like the main outs to mirror or choose Main Outs to operate them as their own independent pair.

Lets you choose what to monitor with the 896mk3's programmable front panel meters.

If you are running an 896mk3 interface at a high sample rate (88.2, 96, 176.4 or 192 kHz), this option appears in the interface tab. It lets you choose a word clock output rate that either matches the global sample rate (e.g. 96kHz) or reduces it to the corresponding 1x rate (e.g. 48kHz instead of 192 kHz).

Choose the output pair you would like the main outs to mirror or choose Main Outs to operate them as their own independent pair.

OVERVIEW
The 896mk3 Hybrid is a hybrid FireWire USB2 audio interface for Mac and Windows that provides 28 separate inputs and 32 separate outputs (at 44.1 or 48kHz). Both analog and digital I/O are offered at sample rates up to 96 kHz, and analog recording and playback is offered at rates up to 192 kHz. All inputs and outputs can be accessed simultaneously. The 896mk3 Hybrid consists of a standard 19-inch, double space, rack-mountable I/O unit that connects directly to a computer via a standard FireWire or USB cable.

The 896mk3 offers the following main features:

- Universal computer connectivity via FireWire or high-speed USB2
- Eight 24-bit XLR analog outputs
- Eight 24-bit analog inputs equipped with XLR/TRS “combo” jacks
- Eight mic preamps (one on each input)
- Independent 48V phantom power and 20 dB pad for each mic input
- Independent front-panel Precision Digital Trim™ for each input
- Two extra XLR analog main outs
- Operation on all analog I/O at standard sample rates up to 192 kHz
- Two banks of optical digital I/O that provide 16 channels of ADAT optical at 48 kHz, 8 channels of S/MUX optical I/O at 96 kHz or two banks of stereo TOSLINK at rates up to 96 kHz
- AES/EBU digital I/O at samples rates up to 96 kHz with sample rate conversion
- RCA S/PDIF at sample rates up to 96 kHz
- Word clock input and output
- On-board SMPTE synchronization via any analog input and output
- Two FireWire jacks for chaining multiple units
- Foot switch input for hands-free punch-in/out
- Two phone jacks with independent volume control
- Programmable master volume knob
- CueMix™ FX no-latency mixing, monitoring and effects processing
- Front-panel LCD programming for the mixer and all other settings
- Dedicated 10-segment LED level meters for all eight analog inputs
- Dedicated 10-segment level meters for main outs
- Programmable 10-segment LED level meters that display levels for any 8-channel input or output bank, as well as AES/EBU or S/PDIF digital I/O
- Auto-switching international power supply
- Stand-alone operation
Mac and Windows drivers for multi-channel operation and across-the-board compatibility with any audio software on current Mac and Windows systems

AudioDesk™, full-featured audio workstation software for Mac OS X that supports both 16-bit and 24-bit recording

With a variety of I/O formats, mic preamps, no-latency mixing and processing of live input and synchronization capabilities, the 896mk3 Hybrid is a complete, portable “studio in a box” when used with a Mac or Windows computer.

THE 896MK3 HYBRID REAR PANEL
The 896mk3 Hybrid rear panel has the following connectors:

- Eight 24-bit 192 kHz XLR analog outputs
- Eight 24-bit 192 kHz “combo” (XLR + balanced quarter-inch) analog inputs, each equipped with a mic preamp, front-panel 48V phantom power switch, pad switch, and trim knob
- Two XLR main analog outputs with front-panel volume knob
- Two sets of optical connectors (in and out), individually switchable among ADAT optical “lightpipe”, 96 kHz S/MUX optical or S/PDIF “TOSLINK”
- AES/EBU input and output
- RCA S/PDIF in/out
- BNC word clock input and output
- Two 1394 FireWire B connectors
- One high-speed USB2 connector

28 inputs and 32 outputs
All 896mk3 inputs and outputs can be used simultaneously, for a total of 28 inputs and 32 outputs at 44.1/48kHz:

* The phone jack below the MASTER VOL knob is hard-wired to (mirrors) the XLR main outs. The PHONES output can operate as an independent output pair, or it can mirror any other 896mk3 output pair, such as the main outs.

† The 896mk3 optical connectors support several standard optical I/O formats, which provide varying channel counts. See “Optical input/output” on page 45 for details about optical bank operation.

With the exception of the phone jack on the front panel labeled “(MAIN OUT)”*, all inputs and outputs are discrete. For example, using the main outs does not “steal” an output pair from the bank of eight XLR analog outputs. The same is true for the headphone outs.

Analog
All 10 analog inputs and outputs are equipped with 24-bit 192 kHz A/D converters. All audio is carried to the computer in a 24-bit data stream.

Mic/guitar preamps
All eight analog inputs are equipped with a preamp on a combo-style connector that accepts either an XLR or quarter-inch (guitar) plug. Individual 48V
phantom power and 20 dB pad are supplied by separate front panel switches for each input. In addition, each input has its own trim knob.

**Precision Digital Trim™**
All of the 896mk3’s analog inputs are equipped with digitally controlled analog trims, adjustable in approximately 1 dB increments. The mic/ instrument input trims can be adjusted using front-panel digital rotary encoders that provide feedback in the front panel LCD with up to 53 dB of boost. All analog inputs can be trimmed with the front panel knobs or with the 896mk3’s included CueMix FX control software for Mac and Windows. This gives you finely-tuned control of trim settings for a wide variety of analog inputs for optimum levels. Different trim configurations can then be saved as preset configurations for instant recall.

**Analog input overload protection**
All eight mic inputs are equipped with V-Limit™, a hardware limiter that helps prevent digital clipping from overloaded input signals. With V-Limit enabled, signals can go above zero dB (with limiting applied) to as high as +12 dB above zero with no distortion due to digital clipping.

Additional or alternative protection can be applied to the mic/guitar inputs by enabling the 896mk3’s Soft Clip feature, which engages just before clipping occurs and helps reduce perceptible distortion.

**Main Outs**
The main outs are equipped with 24-bit 192kHz D/A converters and serve as independent outputs for the computer or for the 896mk3’s on-board CueMix FX mixes. The main out volume can be controlled with the front panel volume knob.

**Optical**
The two optical banks provide 16 channels of ADAT optical at 44.1 or 48 kHz, 8 channels of S/MUX optical I/O at 96 kHz or two banks of stereo TOSLINK at rates up to 96 kHz. The banks operate independently, including input and output, allowing you to mix and match any optical formats. For example, you could receive 4 channels of 96 kHz S/MUX input on Bank A while at the same time sending 96 kHz stereo optical S/PDIF (“TOSLINK”) from the Bank A output.

**AES/EBU with sample rate conversion**
The 896mk3 rear panel provides a standard AES/EBU digital input and output that supports digital I/O at 44.1, 48, 88.2 and 96 kHz. In addition, input or output can be sample-rate converted to any of these sample rates in situations that call for a different rate than the 896mk3’s global sample rate. The AES/EBU jacks are disabled at the 4x sample rates (176.4 and 192kHz).

**S/PDIF**
The 896mk3 rear panel provides S/PDIF input and output in two different formats: RCA “coax” and optical “TOSLINK”. The RCA jacks are dedicated to the S/PDIF format. The TOSLINK jacks can be used for either TOSLINK or ADAT optical, as discussed earlier.

**Word clock**
The 896mk3 provides standard word clock that can slave to any supported sample rate. In addition, word clock can resolve to and generate “high” and “low” sample rates. For example, if the 896mk3 global sample rate is set to 96 kHz, the word clock input can resolve to a “low” rate of 48 kHz. Similarly, when the 896mk3 is operating at 192 kHz, MOTU Audio Setup lets you choose a word clock output rate of 48 kHz (the Force 44.1/48kHz setting).
On-board SMPTE synchronization
The 896mk3 can resolve directly to SMPTE time code via any TRS analog input, without a separate synchronizer. The 896mk3 can also generate SMPTE time code via any XLR analog output. The 896mk3 provides a DSP-driven phase-lock engine with sophisticated filtering that provides fast lockup times and sub-frame accuracy.

The included MOTU SMPTE Setup™ software provides a complete set of tools for generating and regenerating SMPTE time code, which allows you to slave other devices to the computer. Like CueMix FX, the synchronization features are cross-platform and compatible with all audio sequencer software that supports them.

Hybrid FireWire/USB2 connectivity
FireWire has long been recognized as a reliable, high-performance connectivity standard for professional MOTU audio interfaces. Meanwhile, high-speed USB2 has also developed into a widely adopted standard for connecting peripheral devices to personal computers.

To fully support both formats, the 896mk3 Hybrid audio interface is equipped with both FireWire B (400 Mbit/sec) connectors and a high-speed USB2 (480 Mbit/sec) connector, and you can use either port to connect the 896mk3 to your computer. This gives you maximum flexibility and compatibility with today’s ever-expanding universe of Mac and Windows computers.

THE 896MK3 HYBRID FRONT PANEL

Metering
The front panel of the MOTU 896mk3 displays two eight-channel banks of 10-segment ladder LEDs. The left-hand bank always shows the eight analog inputs. The right-hand bank shows any other bank you choose with the Meters knob: Analog out, optical I/O (ADAT or TOSLINK) or digital I/O (AES/EBU and S/PDIF). A status LED to the right shows which bank you are currently viewing. You can also adjust this setting in the MOTU Audio Setup software.

The 896mk3 front panel also displays stereo meters for the main analog outs.

The Clock lights indicate the global sample rate (as chosen in the MOTU Audio Setup software). The Rate Convert LEDs indicate if sample rate conversion is being applied to the AES/EBU input or output, and if so, the rate being converted to.

Input trim knobs, phantom power & 20 dB Pad
The front-panel input trim knobs provide 53 dB of boost, -20 dB pad (by pushing the knob), and 48V phantom power (by holding in the knob) for each mic input.

Headphone output and main volume control
The 896mk3 front panel provides two independent headphone jacks with independent volume knobs, one of which also controls the XLR main outs on the rear panel. Alternately, this MASTER VOL knob can be programmed to control any combination of outputs (analog and/or digital). For example, it can control monitor output for an entire 5.1 or 7.1 surround mix.

Foot switch
The quarter-inch Foot Switch jack accepts a standard foot switch. When you push the foot switch, the 896mk3 triggers a programmable keystroke on the computer keyboard. For example, you could program the foot switch to toggle recording in your host software. The MOTU Audio Setup software lets you program any keystroke you wish.
Programmable backlit LCD display
Any 896mk3 setting, including the powerful CueMix FX on-board 16-bus mixer with effects, can be accessed directly from the front panel using the four rotary encoders and the 2x16 backlit LCD display.

16-BIT AND 24-BIT RECORDING
The 896mk3 system handles all data with a 24-bit signal path, regardless of the I/O format. You can record and play back 16-bit or 24-bit audio files at any supported sample rate via any of the 896mk3’s analog or digital inputs and outputs. 24-bit audio files can be recorded with any compatible host application that supports 24-bit recording.

CUEMIX FX 32-BIT FLOATING POINT MIXING AND EFFECTS
All 896mk3 inputs and outputs can be routed to the on-board CueMix FX 16-bus (8 stereo) digital mixer driven by hardware-based DSP with 32-bit floating point precision. The mixer allows you to apply no-latency effects processing to inputs, outputs or busses directly in the 896mk3 hardware, independent of the computer. Effects can even be applied when the 896mk3 is operating stand-alone (without a computer) as a complete rack-mounted mixer. Input signals to the computer can be recorded wet, dry, or dry with a wet monitor mix (for musicians during recording, for example).

Effects include reverb, parametric EQ and compression/limiting. The 896mk3’s Classic Reverb™ provides five different room types, three frequency bands with adjustable crossover points, shelf filtering and reverb lengths up to 60-seconds.

Two forms of compression are supplied: a standard compressor with conventional threshold/ratio/attack/release/gain controls and the Leveler™, an accurate model of the legendary LA-2A optical compressor, which provides vintage, musical automatic gain control.

CueMix FX also provides 7-band parametric EQ modeled after British analog console EQs, featuring 4 filter styles (gain/Q profiles) to effectively cover a wide range of audio material. Low-pass and high-pass filters are also supplied with slopes that range from 6 to 36 dB. The EQ employs extremely high precision 64-bit floating point processing.

The 896mk3’s flexible effects architecture allows you to apply EQ and compression on every input and output (a total of 58 channels), with enough DSP resources for at least one band of parametric EQ and compression on every channel at 48 kHz. However, DSP resources are allocated dynamically and a DSP meter in the CueMix FX software allows you to keep tabs on the 896mk3’s processing resources. Each input, output and mix bus provides a send to the Classic Reverb processor, which then feeds reverb returns to mix busses and outputs, with a selectable split point between them to prevent send/return feedback loops.

INCLUDED SOFTWARE
The 896mk3 software installer provides the following including cross-platform software applications for Mac and Windows.

MOTU Audio Setup
MOTU Audio Setup provides access to basic hardware settings, such as sample rate, optical I/O format selection, headphone output channel selection, foot switch input programming, and other settings.

MOTU SMPTE Setup
MOTU SMPTE Setup provides access to the 896mk3 system’s SMPTE time code synchronization features, including locking to time code, generating time code, displaying a time code read-out, and so on.
**CueMix FX**
CueMix FX gives you complete control over the 896mk3’s CueMix FX on-board mixer, which provides no-latency monitoring, mixing and processing of live inputs through your 896mk3.

CueMix FX provides attractive graphic mixing, graphic editing of parametric EQ and a convenient tabbed interface for quick access to all mixing features, digitally controlled trims and other settings in your MOTU audio interface.

CueMix FX provides many advanced features, such as an accurate instrument tuner and an extensive arsenal of audio analysis tools, including a real-time FFT, spectrogram “waterfall” display, oscilloscope, and phase analysis tools.

**AUDIODESK**
AudioDesk is a full-featured, 24-bit audio workstation software package included with the 896mk3 system (for Mac OS X only). AudioDesk provides multi-channel waveform editing, automated virtual mixing, graphic editing of ramp automation, real-time effects plug-ins with 32-bit floating point processing, crossfades, support for many third-party audio plug-ins, background processing of file-based operations, sample-accurate editing and placement of audio, and more.

**DIGITAL PERFORMER**
The 896mk3 system is fully integrated with MOTU’s award-winning Digital Performer audio sequencer software package.

**OTHER HOST AUDIO SOFTWARE**
The 896mk3 system includes a standard Mac OS X Core Audio driver for multichannel I/O with any audio application that supports Core Audio.
CHAPTER 2  Packing List and System Requirements

PACKING LIST
The 896mk3 Hybrid ships with the items listed below. If any of these items are not present in your 896mk3 box when you first open it, please immediately contact your dealer or MOTU.

- One 896mk3 Hybrid I/O rack unit
- One 9-pin to 9-pin IEEE 1394 “FireWire” B cable
- One USB cable
- Power cord
- One 896mk3 Hybrid Mac/Windows manual
- One cross-platform installer disc
- Product registration card

MAC SYSTEM REQUIREMENTS
The 896mk3 system requires the following Mac system:

- PowerPC G4 CPU 1 GHz or faster (including PowerPC G5 CPUs and all Intel processor Macs)
- 1 GB RAM; 2 GB or more recommended
- Mac OS X version 10.5, 10.6, or 10.7; v10.5.8 or later required
- Available FireWire or USB2 port
- A large hard drive (preferably at least 250 GB)

PLEASE REGISTER TODAY!
Please register your 896mk3 today. There are two ways to register.

- Visit www.motu.com/register

OR

- Fill out and mail the included product registration card

As a registered user, you will be eligible to receive technical support and announcements about product enhancements as soon as they become available. Only registered users receive these special update notices, so please register today.

Be sure to do the same for the included AudioDesk software, which must be registered separately. You can do so online or by filling out and mailing the included software registration card found at the beginning of your AudioDesk manual. Please be sure to register AudioDesk as well, so that you will be eligible to receive technical support and announcements about AudioDesk software enhancements as soon as they become available.

Thank you for taking the time to register your new MOTU products!

INSTALLATION
Before you connect the 896mk3 to your computer and power it on, run the 896mk3 software installer. This ensures that all the 896mk3 components are properly installed in your system.

Run the MOTU Audio installer
Install the 896mk3 Hybrid software as follows:

1 Insert the MOTU Audio Installer disc; or, if you have downloaded the MOTU Audio installer, locate the folder containing the download.

2 Read the Read Me file for installation assistance and other important information.

3 Open the MOTU Audio Installer application.

4 Follow the directions that the installer gives you.

Drivers are installed, along with MOTU Audio Setup, CueMix FX, and other components, summarized in the table below.

MOTU AUDIO DRIVER
Core Audio is a term that refers to the software technology built into Mac OS X that provides all of its standardized audio features. More specifically, we use Core Audio to refer to Mac OS X's standard audio driver model. The MOTU Core Audio driver provides multi-channel audio input and output with any Mac OS X Core Audio-compatible software.

For details about using the 896mk3 with Core Audio applications, see chapter 7, "Configuring Host Audio Software" (page 59).

MOTU AUDIO SETUP
MOTU Audio Setup (available in the Applications folder) gives you access to all of the settings in the 896mk3, such as the clock source and sample rate. For complete details, see chapter 5, “MOTU Audio Setup” (page 41).

CUEMIX FX
CueMix FX (available in the Applications folder) provides control over the 896mk3’s no-latency CueMix FX on-board mixing and effects processing. For details, see chapter 9, “CueMix FX” (page 73).

MOTU SMPTE SETUP
MOTU SMPTE Setup (available in the Applications folder) software provides a complete set of tools to resolve the 896mk3 to SMPTE time code, and to generate SMPTE for striping, regenerating or slaving other devices to the computer. For details, see chapter 10, “MOTU SMPTE Setup” (page 121).

AUDIODESK WORKSTATION SOFTWARE
AudioDesk is an advanced workstation software package for the 896mk3 that lets you record, edit, mix, process, bounce and master multi-track digital audio recording projects. Advanced features include real-time 32-bit effects processing, 24-bit recording, and much more.

See the AudioDesk User Guide included with your 896mk3 system for details.

CONNECT THE 896MK3 INTERFACE
Your 896mk3 Hybrid audio interface is equipped
with both FireWire B connectors (running at
400 Mbit/sec) and a high-speed USB2 connector
(480 Mbit/sec), and you can use either port to
connect the 896mk3 to your computer. This gives
you maximum flexibility and compatibility with
today's ever-expanding universe of Mac and
Windows computers.

Type B FireWire ports
The 896mk3 Hybrid has two FireWire Type B
ports, which provide the most reliable FireWire
connection available. The ports operate at 400
Mbit/s, and they can be connected to any available
FireWire port on your computer, either Type A or
Type B. If your computer has FireWire Type B
ports, use the included 9-pin-to-9-pin FireWire
cable. If your computer has either standard Type A
ports or miniature Type A ports, use the
appropriate 9-pin-to-6-pin or 9-pin-to-4-pin
FireWire cable (sold separately).

Which should I use: FireWire or USB2?
If your computer does not have a FireWire port,
then obviously you will need to connect the
896mk3 Hybrid to one of its high-speed USB 2.0
ports.

If your computer has both FireWire and USB2,
then it is your choice, and your decision may
depend mostly on other peripherals you may have.

If you are connecting via FireWire
1 Before you begin, make sure your computer and
the 896mk3 are switched off.

2 Plug one end of the 896mk3 FireWire cable
(included) into the FireWire socket on the
computer as shown below in Figure 4-1.

You can also connect the 896mk3 to a 400Mbit
"FireWire A" port using a 9-pin-to-6-pin FireWire
B cable (not included). The 896mk3 will still
operate at its specified 400Mbit (FireWire A) data
rate.

3 Plug the other end of the FireWire cable into the
896mk3 as shown below in Figure 4-1.
INSTALLING THE 896MK3 HARDWARE

Figure 4-1: Connecting the 896mk3 to the computer via FireWire.

Make absolute sure to align the notched side of the FireWire plug properly with the notched side of the FireWire socket on the 896mk3. If you attempt to force the plug into the socket the wrong way, you can damage the 896mk3.

High Speed USB 2.0 versus USB 1.1
There are primarily two types of USB host controllers widely available on current personal computers. USB 1.1 controllers support simple peripherals that don’t require a high speed connection, such as a computer keyboard, a mouse, or a printer. USB 2.0 controllers support high speed devices such as the 896mk3. Since the 896mk3 requires a high speed connection, it must be connected to a USB 2.0 host controller or hub.

For the most reliable connection, it is recommended that you connect the 896mk3 directly to one of your computer’s USB 2.0-compatible ports. However, since USB 2.0 hubs are compatible with both types of devices, the 896mk3 can be connected to a USB 2.0 hub along with USB 1.1 devices if necessary. The 896mk3 will not operate properly if it is connected to a USB 1.1 hub.

Follow these instructions to determine whether your computer supports USB 1.1 or USB 2.0:

1. In the Apple menu, choose About this Mac.
2. Click the More Info button to open System Profiler.
3. In the Contents pane, select USB.
4. Look at the devices in the USB Device Tree. A device named USB High-Speed Bus represents a USB 2.0 root hub. A device named USB Bus represents a USB 1.1 root hub.

If you are connecting via high-speed USB 2.0
1. Before you begin, make sure your computer and the 896mk3 are switched off.
2. Plug the flat “type A” plug of the 896mk3 USB cable (included) into a USB2-equipped socket on the computer as shown below in Figure 4-2.
3. Plug the squared “type B” plug of the USB cable into the 896mk3 I/O as shown below in Figure 4-2.

Figure 4-2: Connecting the 896mk3 to the computer via USB.
CONNECT AUDIO INPUTS AND OUTPUTS

The 896mk3 audio interface has the following audio input and output connectors:

- 8 combo-style XLR/quarter-inch analog inputs
- 8 XLR analog outputs
- 2 XLR main outs
- AES/EBU input/output
- S/PDIF input/output
- ADAT optical input/output

Here are a few things you should keep in mind as you are making these connections to other devices.

Analog inputs
Connect a microphone, guitar, instrument or line level analog input to any XLR/quarter-inch combo jack with either a standard mic cable or a balanced/unbalanced cable with a quarter-inch plug.

Phantom power
If you are connecting a condenser microphone or other device that requires phantom power, push and hold the corresponding front-panel Trim rotary encoder for a few seconds to toggle phantom power. The red LED will turn on or off accordingly.

Always disable phantom power before inserting a quarter-inch plug.

Trim
Both the XLR mic input and the high-impedance quarter-inch guitar input are equipped with 53 dB gain. Use the corresponding front panel trim knob to adjust the input level as needed for each input. The LCD provides visual feedback as you turn the trim knob.

-20 dB pad
If the input signal is too hot with the trim turned all the way down, engage the -20dB pad for the input on the front panel. To toggle the -20 dB pad for an input, quickly push its TRIM rotary encoder. The green LED will turn on or off accordingly.

For line level quarter-inch inputs, turn on the pad.
**Combo jack summary**
Use these general guidelines for the 48V phantom power, pad and trim settings for the combo inputs:

**Analog outputs**
For the XLR outputs, use high-quality shielded cables.

**Main outs**
The XLR main outputs serve as independent outputs. From the factory, the main out volume is controlled by the MASTER VOL knob on the front panel, although this knob can be programmed to control any combination of outputs. For details, see “The Monitor Group” on page 96. In a standard studio configuration, the main outs are intended for a pair of studio monitors, but they can also be used as additional outputs for any purpose.

**Optical**
The 896mk3 rear panel provides two sets of ADAT optical (“lightpipe”) connectors: Bank A and B (Figure 4-5). Each bank provides an input and output connector. All four connectors can operate independently and offer two different optical formats: ADAT optical or TOSLINK (optical S/PDIF). For example, you could connect 8-channel ADAT optical input from your digital mixer and stereo TOSLINK output to an effects processor.

The 896mk3 supplies +12dB of digital trim (boost) for each optical input, which can be adjusted from CueMix FX (“Input trim” on page 80) or the front panel (“The IN (inputs) menu” on page 54).

Below is a summary of optical formats:

<table>
<thead>

</tbody>
</table>

**Optical operation at 44.1 or 48 kHz**
When configured for ADAT “lightpipe”, an optical connector provides 8 channels at 44.1 and 48 kHz.

**ADAT optical operation at 88.2 or 96 kHz**
When configured for ADAT “lightpipe”, an optical connector provides four channels at 88.2 or 96 kHz (2x sample rates). When using the ADAT lightpipe format at a 2x rate, be sure to choose either Type I or Type II operation, as explained in “ADAT SMUX Type” on page 53.
Using optical I/O to operate the 896mk3 as an 8-channel expander

When the 896mk3 is not connected directly to a computer via FireWire or USB, the optical outputs can be programmed (via the CueMix FX mixer) to mirror the incoming signal on any combination of the 896mk3's inputs. By connecting the 896mk3 optical outputs to another device, such as another ADAT-optical equipped interface or a digital mixer, you add additional inputs to your system.

To learn how to program the 896mk3 when it is operating as a stand-alone expander in this fashion, see chapter 6, “Front Panel Operation” (page 43).

Choosing a clock source for optical connections

Be sure to review the digital audio clocking issues, as explained in “Syncing optical devices” on page 30.

S/PDIF

If you make a S/PDIF digital audio connection to another device, be sure to review the digital audio clocking issues, as explained in “Syncing S/PDIF devices” on page 29.

The 896mk3 supplies +12dB of digital trim (boost) for the S/PDIF input pair, which can be adjusted from CueMix FX (“Input trim” on page 80) or the front panel (“The IN (inputs) menu” on page 54).

AES/EBU

Connect standard AES/EBU input and output. 2x sample rates (88.2 & 96 kHz) are supported; 4x sample rates (176.4 or 192kHz) are not supported.

Be sure to review the digital audio clocking issues, as explained in “Syncing AES/EBU devices” on page 30.

The 896mk3 supplies +12dB of digital trim (boost) for the AES/EBU input pair, which can be adjusted from CueMix FX (“Input trim” on page 80) or the front panel (“The IN (inputs) menu” on page 54).

CONNECT A FOOT SWITCH

If you would like to use a foot switch with your 896mk3, connect it to the FOOT SWITCH jack.

See “Enable Pedal” on page 47 for information about how to program the foot switch to trigger any computer keystroke you wish.
A TYPICAL 896MK3 SETUP
Here is a typical 896mk3 studio setup. This rig can be operated without a conventional mixer. All mixing and processing can be done either in the 896mk3, in the computer with audio software, or both. During recording, you can use the 896mk3’s CueMix™ FX mixer to apply reverb, EQ and compression to what you are recording and monitor it via the main outs, headphone outs, or any other output pair. You can control everything from the included CueMix Console software.

Figure 4-6: A typical 896mk3 studio setup.
OPERATING THE 896mk3 AS A CONVERTER
As explained earlier in “Using optical I/O to operate the 896mk3 as an 8-channel expander” on page 25, the 896mk3 can serve as a multi-channel analog-to-digital converter when disconnected from the computer and instead connected to another device equipped with an ADAT optical input. For example, you could connect the 896mk3 optical output to the optical input on another MOTU audio interface, such as a Traveler, 828mk3 or even another 896mk3. The 896mk3 then serves as a multi-channel expander that adds additional mic/analog and digital inputs to the interface. The benefit of connecting the 896mk3 in this manner (instead of as another FireWire interface) is that you can seamlessly integrate the 896mk3’s inputs into the on-board no-latency CueMix monitor mixing in the interface, since the 896mk3’s inputs are fed into CueMix via the interface’s optical inputs.

If the device to which you are connecting the 896mk3 supports 2x optical sample rates (88.2 or 96 kHz), you can also use both banks of connectors as discussed in “ADAT optical operation at 88.2 or 96 kHz” on page 24.
MAKING SYNC CONNECTIONS
If you connect devices digitally to the 896mk3, or if you need to synchronize the 896mk3 with an outside time reference such as SMPTE time code, you must pay careful attention to the synchronization connections and clock source issues discussed in the next few sections.

Do you need to synchronize the 896mk3?
If you will be using only the 896mk3’s analog inputs and outputs (and none of its digital I/O), and you have no plans to synchronize your 896mk3 system to SMPTE time code or other external clock source, you don’t need to make any sync connections. You can skip this section and proceed to chapter 5, “MOTU Audio Setup” (page 41), where you’ll open MOTU Audio Setup and set the Clock Source setting to Internal as shown below. For details, see chapter 5, “MOTU Audio Setup” (page 41).

Situations that require synchronization
There are three general cases in which you will need to resolve the 896mk3 with other devices:

- Synchronizing the 896mk3 with other digital audio devices so that their digital audio clocks are phase-locked (as shown in Figure 4-9)
- Resolving the 896mk3 system to SMPTE time code from a video deck, analog multi-track, etc.
- Both of the above

Synchronization is critical for clean digital I/O
Synchronization is critical in any audio system, but it is especially important when you are transferring audio between digital audio devices. Your success in using the 896mk3’s digital I/O features depends almost entirely on proper synchronization. The following sections guide you through several recommended scenarios.

Be sure to choose a digital audio clock master
When you transfer digital audio between two devices, their audio clocks must be in phase with one another — or phase-locked. Otherwise, you’ll hear clicks, pops, and distortion in the audio — or perhaps no audio at all.

There are two ways to achieve phase lock: slave one device to the other, or slave both devices to a third master clock. If you have three or more digital audio devices, you need to slave them all to a single master audio clock.

Also remember that audio phase lock can be achieved independently of time code (location). For example, one device can be the time code master while another is the audio clock master. But only one device can be the audio clock master. If you set things up with this rule in mind, you’ll have trouble-free audio transfers with the 896mk3.
SYNCING S/PDIF DEVICES

S/PDIF devices will sync to the 896mk3 in one of two ways:

- Via the S/PDIF connection itself
- Via word clock

S/PDIF devices with no word clock

If your S/PDIF device has no word clock sync connectors, just connect it to the 896mk3 via the S/PDIF connectors. When the device records S/PDIF audio (from the 896mk3), it will simply synchronize to the clock provided by the audio input.

On the other hand, when you transfer audio from the S/PDIF device into the 896mk3, you'll have to slave the 896mk3 to its S/PDIF input. If you have other digital audio devices connected to the 896mk3, and they are not slaved directly to the 896mk3 itself, you may hear clicks and pops resulting from their unsynchronized audio clock. If so, just turn them off during the transfer.

S/PDIF devices with word clock

If your S/PDIF device has a Word Clock input, slave the S/PDIF device to the 896mk3 via their word clock connection. You can then freely transfer audio between the 896mk3 and the S/PDIF device.

Figure 4-11: Two setups for synchronizing a S/PDIF device with the 896mk3. In the top diagram, sync is achieved via the S/PDIF connection itself. In this case, you have to choose S/PDIF as the 896mk3’s clock source when recording from the S/PDIF device. If you don’t want to have to worry about switching the Clock Source setting depending on the direction of the S/PDIF transfer, you can slave the S/PDIF device to word clock from the 896mk3 or vice versa (not shown). The Word Clock connection maintains sync, regardless of the direction of the transfer.

With this setup, in the MOTU Audio Setup window, choose Internal, or any other clock source setting except S/PDIF. The DAT deck (or other SPDIF device) slaves to the 896mk3 via word clock for SPDIF transfers in both directions.
SYNCHRONIZING OPTICAL DEVICES
When connecting an optical device, make sure that its digital audio clock is phase-locked (in sync with) the 896mk3, as explained in “Making sync connections” on page 28. There are two ways to do this:

1. Resolve the optical device to the 896mk3
2. Resolve the 896mk3 to the optical device

For 1), choose Internal (or any other clock source except ADAT optical) as the clock source for the 896mk3 in MOTU Audio Setup.

For 2), choose either ADAT Optical A or ADAT Optical B as the 896mk3’s clock source (Figure 4-12). Be sure to choose the optical port that the device is connected to.

Figure 4-12: Resolving the 896mk3 to an optical device.

For details about using the clock source setting and the MOTU Audio Setup software in general, see chapter 5, “MOTU Audio Setup” (page 41).

Using word clock to resolve optical devices
If the optical device you are connecting to the 896mk3 has word clock connectors on it, you can use them to resolve the device to the 896mk3, similar to the diagram shown in Figure 4-11 on page 29 for S/PDIF devices with word clock. Also see “Syncing word clock devices” on page 33.

SYNCHING AES/EBU DEVICES
If you would like to transfer stereo audio digitally between the 896mk3 and another device that has AES/EBU, connect it to the 896mk3’s AES/EBU jacks with balanced, AES/EBU grade audio cables.

AES/EBU clock and sample rate conversion
The 896mk3 AES/EBU section is equipped with a real-time sample rate converter that can be used for either input or output. This feature provides a great deal of flexibility in making digital transfers. For example, you can:

- Transfer digital audio into the 896mk3 at a sample rate that is completely different than the 896mk3 system clock rate.
- Transfer digital audio into the 896mk3 without the need for any external synchronization arrangements.
- Transfer digital audio out of the 896mk3 at double or half the 896mk3 system clock rate.

Rate conversion does not add any appreciable noise to the audio signal (under -120 dB).

Digital audio phase lock
Without sample rate conversion, when you transfer digital audio between two devices, their audio clocks must be in phase with one another — or phase-locked — as discussed earlier in “Be sure to choose a digital audio clock master” on page 28 and Figure 4-10 on page 28. Otherwise, you’ll hear clicks, pops, and distortion in the audio, or perhaps no audio at all. Phase lock ensures a clean digital audio transfer.

Another benefit of direct master/slave clocking (without sample rate conversion) is that each slaved device remains continuously resolved to the master, which means that there will be no gradual drift over time. This form of synchronization is best for audio that needs to remain resolved to film, video, etc.
**Sample rate conversion**

With sample rate conversion (SRC), an extra level of master/slave clocking is added to the equation, as demonstrated below in Figure 4-13, which shows the clocking going on when you transfer digital audio from the 896mk3 (AES/EBU OUT) to a DAT deck (AES/EBU IN) using SRC. Notice that with SRC, the DAT deck is not slaved to the 896mk3’s system clock. Instead, their clocks are running completely independently of one another. But also notice that the DAT deck must still slave to the sample-rate-converted output from the 896mk3 for a clean digital audio transfer (unless it has its own sample rate converter on its AES/EBU input).

![Diagram showing clock relationships when sending audio from the 896mk3 to a DAT deck using sample rate conversion. The DAT deck needs to be slaving to its AES/EBU input. *Note: the 896mk3 AES/EBU output can actually be clocked from a number of different sources. In this example, it is resolved to the 896mk3 system clock. For details about other possible clock sources, see “Clocking scenarios for AES/EBU input” on page 32.](image)

These options are mentioned briefly in the following sections. For further details, see “Clock Source” on page 43 and “Sample Rate Convert” on page 46.

**Clocking scenarios for AES/EBU input**

There are three possible clocking scenarios for the 896mk3 AES/EBU input:

1. Simple transfer (slave the 896mk3 system clock to the AES/EBU input signal — no sample rate conversion).
2. Sample rate convert the AES/EBU input.
3. Use word clock to resolve the 896mk3 system clock and the other AES/EBU device with each other.

These three AES/EBU input scenarios are summarized below.

**System clock, AES clock & rate convert settings**

When you are setting up AES/EBU input and output with the 896mk3, pay careful attention to the following settings in MOTU Audio Setup (see the quick reference overview on page 9):

- Clock source
- Sample rate conversion
Some example scenarios are demonstrated below.

Simple AES/EBU input transfer (no rate convert)

![Figure 4-14: Slaving the 896mk3 to an AES/EBU device. For the 896mk3’s clock source, choose ‘AES/EBU’.](image)

AES/EBU input with rate conversion

AES/EBU input with word clock

![Figure 4-16: In this scenario, the 896mk3 and other AES/EBU device are both resolved to one another via a third master word clock source.](image)

Clocking scenarios for AES/EBU output

The 896mk3 AES/EBU output can also employ sample rate conversion. The output options, shown below in Figure 4-17, are briefly summarized in the following sections. For further details, see “Sample Rate Convert” on page 46.

![Figure 4-17: The Sample Rate Conversion option in MOTU Audio Setup gives you access the AES/EBU output clock options.](image)

None

To make the AES/EBU output sample rate match the System sample rate, choose None (Figure 4-17). No sample rate conversion occurs when this setting is chosen.

AES Out slave to AES In

To make the AES/EBU output sample rate match the sample rate currently being received by the 896mk3’s AES/EBU input, choose AES Out Slave to AES In (Figure 4-17). This setting requires a connection to the 896mk3’s AES/EBU input from a device that is transmitting an AES/EBU clock signal.

Be careful when both the 896mk3’s AES/EBU input and output are connected to the same external device: this option is likely to create a clock loop.

AES/EBU Out options

Choose the desired AES/EBU Out sample rate options (Figure 4-17) when the desired AES/EBU output rate needs to be completely different than the system clock rate or the AES In clock rate.
SYNCING WORD CLOCK DEVICES

The 896mk3 word clock connectors allow you to synchronize it with a wide variety of other word clock-equipped devices.

For standard word clock sync, you need to choose an audio clock master (as explained in “Be sure to choose a digital audio clock master” on page 28). In the simplest case, you have two devices and one is the word clock master and the other is the slave as shown below in Figure 4-18 and Figure 4-19.

Don’t chain word clock

If you have three or more digital audio devices that you need to synchronize, avoid chaining their word clock connections (OUT to IN, OUT to IN, etc.), as this causes problems. Instead, use a dedicated synchronizer like the Digital Timepiece or a word clock distribution device of some kind.

Slaving to a 2x and 1/2x word clock

All MOTU FireWire audio interfaces that support 96 kHz operation have the ability to slave to a word clock signal running at either one half or one quarter of their current clock rate. For example, the 896mk3 could be running at 96 kHz while slaving to a 48 kHz word clock signal. Similarly, the 896mk3 could run at 88.2 kHz and slave to 44.1 kHz word clock.

Remember, the word clock signal must be one of the following:

- the same as the 896mk3 clock
- half of the 896mk3 clock

Forcing a 1x word out rate

The 896mk3 can generate a word clock output signal that either matches the current system clock rate (any rate between 44.1 and 192kHz) or the corresponding 1x rate. For example, if the 896mk3 is operating at 192kHz, you can choose to generate a word out rate of 48kHz. For details on how to make this word clock output setting, see “Word Out” on page 47.
SYNCING TO SMPTE TIME CODE

The 896mk3 system can resolve directly to SMPTE time code. It can also generate time code and word clock, under its own clock or while slaving to time code. Therefore, the 896mk3 can act both as an audio interface and as a digital audio synchronizer to which you can slave other digital audio devices. You can use the 896mk3 to slave your audio software to SMPTE as well, via sample-accurate sync (if your host software supports it) or via MIDI Time Code (if your host software supports it).

First, choose SMPTE as the clock source in AudioDesk, Digital Performer, or MOTU Audio Setup. This setting can also be made in the MOTU SMPTE Setup (shown below).

In AudioDesk or Digital Performer:
1. Choose Receive Sync from the Setup menu.
2. Choose the Sample-accurate option. (If this option is grayed out, choose SMPTE as the clock source setting first, as shown above.)
3. Make sure that Slave to External Sync mode is enabled.

In Pro Tools:
1. Choose Peripherals from the Setup menu.
2. Click the Synchronization tab and choose the 896mk3 Sync Port from the MTC Reader Port menu.

This setup provides:
- Continuous sync to SMPTE time code.
- Sub-frame timing accuracy.
- Transport control from the SMPTE time code source.

Use this setup if you have:
- A SMPTE time code source, such as a multitrack tape deck.
- An 896mk3 by itself, OR with another slaved device (such as a digital mixer).
- Host software that supports sample-accurate sync (such as Digital Performer) or MIDI Time Code (such as Pro Tools).

![Connections for synchronizing the 896mk3 directly to SMPTE timecode.](image)

- Figure 4-20: Connections for synchronizing the 896mk3 directly to SMPTE timecode.
CONNECTING MULTIPLE MOTU FIREWIRE INTERFACES

You can daisy-chain up to four MOTU FireWire interfaces on a single FireWire bus, with the restrictions described in the following sections. Most computers have only one built-in FireWire bus (even if it supplies multiple FireWire sockets). Connect them as follows:

Multiple interfaces cannot be bus-powered
Do not run the Traveler, UltraLite or other bus-powered interfaces under bus power when connecting them with other devices on the same FireWire bus.

Multiple interfaces in MOTU Audio Setup
MOTU Audio Setup displays the settings for one interface at a time. To view the settings for an interface, click its tab as shown below in Figure 4-22.

Synchronizing multiple interfaces
Mac OS X provides an advanced, flexible driver model that allows multiple Core Audio drivers to be active at one time, accessed by multiple applications simultaneously. For example, you can run both FireWire and PCI audio interfaces at the same time, accessing all of their inputs and outputs from your host audio application — or even multiple applications — simultaneously. You can take advantage of Mac OS X’s aggregate device driver feature, which allows you to create a unified “meta device” out of several different audio interfaces. The aggregate device presents to your host software all of the inputs and outputs of the included devices.

An important feature of this flexible model is that multiple devices must be synchronized to one another in order to remain resolved to each other. Without synchronization, the audio streams going to each interface might drift with respect to one another. For example, the audio tracks playing back through the 896mk3 might drift out of sync with the audio tracks playing back through your 2408mk3 PCI interface. Synchronizing them to
each other ensures that they remain as tightly and continuously phase-locked as if they were one unified interface.

There are two ways to synchronize the 896mk3 with other devices, as discussed in the following sections: via the driver or via word clock.

Resolving to other Core audio drivers

The MOTU FireWire/USB driver can resolve to other Core Audio drivers. This allows the 896mk3 and other MOTU interfaces to resolve to other audio interfaces running simultaneously on the same computer, such as the Mac’s built-in audio, a PCI-424 core system, or even 3rd-party interfaces, without the need for external word clock connections between the devices. Doing so ensures that audio tracks being played or recorded by your MOTU FireWire/USB interface will not drift apart from tracks on the other device during long playback or recording passes.

To synchronize multiple devices via the MOTU FireWire/USB driver, choose one device (PCI, FireWire, USB or otherwise) as the master clock and then slave the 896mk3 and other devices to it. All interfaces will remain resolved to each other via the master interface.

Make the Clock Source settings for each interface as follows:

- For the master interface, click its tab in MOTU Audio Setup and choose any clock source you wish (except any of the slave interfaces, of course).
- For each slave interface, click its tab and choose the master interface from the Clock Source menu, as demonstrated below in Figure 4-23. This causes the slave interfaces to resolve to the master interface.

If you have multiple 896mk3s, choose one as the master, and set its Clock Source to Internal. Then, click the tab of the other 896mk3s and set their Clock Source to the first 896mk3.

Resolving to word clock

To resolve two 896mk3 interfaces with each other via word clock, choose one as the word clock master and then slave the second interface to the first, as shown in Figure 4-21 on page 35. For three interfaces, you can probably get away with daisy-chaining them via their word clock connectors, but this may not always produce the most reliable results. For three or more devices, a word clock distribution device is highly recommended. In this case, the distribution box is the master, and all interfaces slave directly to it (instead of to each other).

Connecting other MOTU FireWire interfaces

You can mix and match multiple 896mk3 Hybrid interfaces with other MOTU FireWire interfaces using a standard FireWire hub. You can daisy-chain 828mkIIs, 828mk3s, 896HDs, 896mk3s, Travelers,
and Traveler-mk3s, which all have two FireWire ports convenient for daisy-chaining. Up to four interfaces can be combined on one FireWire bus.

**Operating multiple FireWire interfaces at high sample rates**
Four MOTU FireWire interfaces can operate at 44.1 or 48kHz on a single FireWire bus, although you may have to disable optical banks to conserve FireWire bus bandwidth. At the 2x samples rates (88.2 or 96kHz) and 4x sample rates (176.4 and 192kHz), you can operate no more than two interfaces on a single FireWire bus.

**Adding additional interfaces with a second FireWire bus**
Third-party FireWire bus expansion products in the form of a cardbus (“PC card”) adapter or PCI card allow you to add a second FireWire bus to your computer. It may be possible to add additional MOTU FireWire interfaces connected to such a third-party product, depending on their performance with your host computer.
Part 2

Using the 896mk3 Hybrid
CHAPTER 5  MOTU Audio Setup

OVERVIEW
MOTU Audio Setup gives you access to basic 896mk3 hardware settings, such as sample rate, clock source, optical format and more.

ACCESSING THE 896MK3 SETTINGS
There are several ways to access 896mk3 settings:

- Open MOTU Audio Setup from the Applications folder.
- Click the MOTU Audio Setup icon in the dock to open the application's window.
- Right-click on the MOTU Audio Setup dock icon to open the shortcut menu shown below.

- From within your host audio software's audio driver preferences. For example, in Digital Performer or AudioDesk, choose Setup menu> Configure Audio System> Configure Hardware Driver.
  
  Most applications provide access only to basic settings such as sample rate and clock source. For access to all settings, open MOTU Audio Setup using one of the techniques above.
  
- From the front panel LCD as explained in chapter 6,"Front Panel Operation" (page 49).
896mk3 tab settings
The 896mk3 tab (Figure 5-1) provides settings that apply to a specific 896mk3 interface. If you have several 896mk3 (or other MOTU) interfaces connected, you’ll see a separate tab for each one.

General tab settings
The General tab provides settings that apply to all connected MOTU FireWire and USB Audio interfaces.

‘896MK3 HYBRID’ TAB SETTINGS

Sample Rate
Choose the desired Sample Rate for recording and playback. The 896mk3 can operate at 44.1 (the standard rate for compact disc audio), 48, 88.2, 96, 176.4 or 192kHz. If you are operating at a sample rate between 44.1 and 96kHz, make absolutely sure that all of the devices connected digitally to the 896mk3 match the 896mk3’s sample rate. Also make sure that your digital audio synchronizer matches it as well. At the 4x sample rates (176.4 or 192kHz), all digital I/O on the 896mk3 is disabled.

Mismatched sample rates cause distortion and crackling. If you hear this sort of thing, check the sample rate settings in your hardware and here in MOTU Audio Setup.

Operation at 4x sample rates (176.4 or 192kHz)
At the 4x sample rates (176.4 or 192kHz), operation of the 896mk3 is restricted, due to the higher audio bandwidth demands, as follows:

- All digital I/O is disabled (there is no optical, S/PDIF or AES/EBU input/output).
The 896mk3 provides 8 channels of analog input and 8 channels of analog output, simultaneously.

- The stereo return bus, as described in “Return Assign” on page 45, can only be assigned to one of the four available analog output pairs or main outs.
- The PHONES jack can only be assigned to one of the four available analog output pairs or the main outs.
- The MAIN OUT jack can only be assigned to one of four analog output pairs or the main outs.

**Clock Source**
The Clock Source determines the digital audio clock that the 896mk3 will use as its time base. For a complete explanation of synchronization issues, see “Making sync connections” on page 28. The following sections briefly discuss each clock source setting.

**Internal**
Use the Internal setting when you want the 896mk3 to operate under its own digital audio clock. For example, you may be in a situation where all you are doing is playing tracks off hard disk in your digital audio software on the computer. In a situation like this, you most often don’t need to reference an external clock of any kind.

Another example is transferring a mix to DAT. You can operate the 896mk3 system on its internal clock, and then slave the DAT deck to the 896mk3 via the AES/EBU connection (usually DAT decks slave to their AES/EBU input when you choose the AES/EBU input as their record source) or via the 896mk3’s word clock output (if your DAT deck has a word clock input).

If you would like help determining if this is the proper clock setting for your situation, see “Making sync connections” on page 28.

**Word Clock In**
The Word Clock In setting refers to the Word Clock In BNC connector on the 896mk3 rear panel. Choosing this setting allows the 896mk3 to slave to an external word clock source, such as the word clock output from a digital mixer or another 896mk3.

**S/PDIF**
The S/PDIF clock source setting refers to the S/PDIF RCA input jack on the 896mk3. This setting allows the 896mk3 to slave to another S/PDIF device.

Use this setting whenever you are recording input from a DAT deck or other S/PDIF device into the 896mk3. It is not necessary in the opposite direction (when you are transferring from the 896mk3 to the DAT machine).

For further details about this setting, see “Syncing S/PDIF devices” on page 29.

**AES/EBU**
The AES/EBU clock source setting refers to the AES/EBU input connector on the 896mk3. This setting allows the MOTU 896mk3 to slave to another AES/EBU device.

Use this setting whenever you are recording input from a DAT deck or other AES/EBU device into the 896mk3. It is not necessary in the opposite direction (when you are transferring from the 896mk3 to the DAT machine).

For further details about this setting, see “Syncing AES/EBU devices” on page 30.

**ADAT optical A / B**
The ADAT optical clock source settings (ADAT Optical A and ADAT Optical B) refer to the clock provided by the 896mk3’s two optical inputs, when either one is connected to another optical device. These two settings only appear in the Clock Source menu.
menu when their corresponding optical bank input is enabled and set to the ADAT Optical format, as explained in “Optical input/output” on page 45.

This setting can be used to resolve the 896mk3 directly to the optical input connection. Most of the time, you can set up a better operating scenario that uses one of the other synchronization options. However, there may be occasions when you have an optical device that has no way of synchronizing digitally to the 896mk3 or an external synchronizer. In this case, the ADAT Optical clock source setting lets you slave the 896mk3 to the device itself via its digital input to the 896mk3.

This setting is also useful if you just need to make a simple, click-free digital transfer between the 896mk3 and another device — where a time code reference and shared transport control are not needed — without having to set up an elaborate synchronization scenario.

For further details about this setting, see “Syncing optical devices” on page 30.

TOSLINK A / B
The TOSLINK clock source settings (TOSLINK A and TOSLINK B) refer to the clock provided by the 896mk3’s two optical inputs, when either one is connected to another optical device. These two settings only appear in the Clock Source menu when their corresponding optical bank input is enabled and set to the TOSLINK format, as explained in “Optical input/output” on page 45.

The TOSLINK clock source setting refers to the clock provided by an optical S/PDIF device connected to the 896mk3’s optical input. This setting can be used to slave the 896mk3 directly to the optical input connection. Most of the time, you can set up a better operating scenario that uses one of the other synchronization options. However, there may be occasions when you have a TOSLINK-compatible device that has no way of synchronizing digitally to the 896mk3 or an external synchronizer such as the Digital Timepiece. In this case, the TOSLINK clock source setting lets you slave the 896mk3 to the other device via the 896mk3’s optical input.

This setting is also useful if you just need to make a simple, click-free digital transfer between the 896mk3 and another device — where a time code reference and shared transport control are not needed — without having to set up an elaborate synchronization scenario.

For further details, see “Syncing optical devices” on page 30.

SMPTE
Choose this setting to resolve the 896mk3 directly to SMPTE time code (L TC) being received via the 896mk3’s quarter-inch SMPTE input jack. For details, see “Syncing to SMPTE time code” on page 34 and chapter 10, “MOTU SMPTE Setup” (page 121).

Built-in Audio
Choose this setting to resolve the 896mk3 to your Mac’s built-in audio. Doing so will ensure that audio streams playing back from or recorded by the 896mk3 will not drift apart from audio streams simultaneously played or recorded by the Mac’s built-in mic, speakers or audio output.

Other audio devices (drivers)
The MOTU FireWire Audio Driver has the ability to resolve to other Core Audio drivers. Doing so will ensure that audio streams playing back from or recorded by the 896mk3 will not drift apart from audio streams simultaneously played or recorded by the other devices.

Default Stereo Input/Output
In the System Preferences window (Figure 5-2), Mac OS X lets you choose third-party hardware such as the 896mk3 for your Mac sound input and
output. The system input and output can be used for alert sounds and general audio I/O for applications like iTunes, iMovie, etc.

Figure 5-2: The Mac OS X sound preferences let you use the 896mk3 for general stereo audio input and output for your Mac.

The Default Stereo Input and Default Stereo Output settings in MOTU Audio Setup (Figure 5-1 on page 42) let you specify the stereo input and output on the 896mk3 to be used when it is chosen as the audio I/O device in the system preferences.

Under Mac OS X 10.6 (Snow Leopard) or later, you can use the Mac's volume control, such as the Output volume slider shown in Figure 5-2, or the volume keys on your Mac's keyboard, to control the output level.

Phones Assign
The Phones Assign setting lets you choose what you will hear from the headphone jack. Choose Main Out 1-2 if you'd like to route the Main Out stereo pair to the PHONES jack. Choose Phones 1-2 if you would like the headphones to serve as their own independent output, which you can access as an independent output destination in your host audio software and as an output destination for the four on-board CueMix FX mix busses.

Optical input/output
The Optical input and Optical output settings let you choose between ADAT optical ("lightpipe") and S/PDIF optical ("TOSLINK") as the format for the 896mk3's two banks of optical input and output (Bank A and Bank B). Choose the format that matches the device connected. If you are not using the optical connections, it is recommended that you turn them off (by choosing Disabled from the menu) to reduce bandwidth and processing overhead. Note that you can operate each optical port independently. For example, you could use the ADAT optical format on the Bank A input (for a digital mixer) and optical S/PDIF on the Bank A output (for a DAT deck).

Main Out Assign
Choose Main Outs from the Main Out Assign menu to treat the Main Outs as their own independent output pair. Choose any other output pair to cause the MAIN OUT jacks to mirror (duplicate) the output pair you choose.

Return Assign
The Return Assign menu lets you choose any pair of 896mk3 audio outputs. The audio signal from this output pair is then sent back to the computer via the Stereo Return 1-2 bus. This stereo return bus from the 896mk3 appears in your host software alongside all other 896mk3 inputs, wherever your host software lists them.
The 896mk3 stereo return bus can be used for a variety of purposes. For example, you could use it to send a final mix being played through the 896mk3 back to the computer, where you could record it for mastering or archiving purposes.

As another example, you could use the stereo return bus to capture tracks played from your host software, along with live inputs being routed directly through the 896mk3 hardware via CueMix FX (with or without CueMix effects processing on the live inputs).

Programmable Meters
This option lets you choose which bank you wish to monitor with the eight programmable meters on the MOTU 896mk3 front panel. Your choices are: Analog Out, Optical A In, Optical A Out, Optical B In, Optical B Out, or Digital In/Out. This last option displays AES/EBU input, S/PDIF input, AES/EBU output and S/PDIF output, in order from left to right. You can also adjust this setting by turning the METERS knob on the 896mk3 front panel.

Sample Rate Convert
The Sample Rate Convert option (Figure 4-17 on page 32) lets you control AES/EBU sample rate conversion. Sample rate conversion is available when the 896mk3 is operating at the 1x sample rates (44.1 and 48kHz) or the 2x sample rates (88.2 or 96kHz). AES/EBU is disabled entirely at the 4x samples rates (176.4 and 192kHz). Each option is explained below.

None
To make the AES/EBU output sample rate match the System sample rate, choose None (Figure 4-17 on page 32). No sample rate conversion occurs when this setting is chosen.

AES Out slave to AES In
To make the AES/EBU output sample rate match the sample rate currently being received by the 896mk3’s AES/EBU input, choose AES Out Slave to AES In (Figure 4-17 on page 32). This setting requires a connection to the 896mk3’s AES/EBU input from a device that is transmitting an AES/EBU clock signal.

Be careful when both the 896mk3’s AES/EBU input and output are connected to the same external device: this option is likely to create a clock loop.

AES/EBU Out options
Choose the desired AES/EBU Out sample rate options (Figure 4-17 on page 32) when the desired AES/EBU output rate needs to be completely different than the system clock rate or the AES In clock rate. For further details about this option, see “Sample Rate Convert” on page 46.

Clip Hold Time
The Clip Hold Time option controls how long the top red LED on the front panel metering remains illuminated after clipping occurs.

If you want the ability to clear the LED manually from your host audio software or the CueMix FX app, Choose Infinite from the Clip Hold Time menu. In Digital Performer or AudioDesk, you can clear the 896mk3 clip LEDs by choosing Audio menu>Clear All Clipping Indicators.

Peak Hold Time
The 896mk3 front-panel level meters support standard peak/hold metering, where the LED for the highest level recently measured on the channel remains illuminated for a brief period of time while the rest of the LEDs below it remain fully dynamic. The Peak Hold Time controls how long the peak-hold LED remain illuminated before going dark again.
**Word Out**

The *Word Out* menu appears when the 896mk3 is operating at a 2x sample rate (88.2 or 96kHz) or 4x sample rate (176.4 or 192kHz). This menu lets you set the word clock output either to match the current sample rate (*System Clock*) or force it to the corresponding 1x rate (either 44.1 or 48kHz). For example, if the 896mk3 were operating at 176.4kHz, choosing the *Force 44.1/48kHz* option would produce word clock output at 44.1kHz.

**‘GENERAL’ TAB SETTINGS**

**Launch MOTU Audio Setup when hardware becomes available**

Check this option if you would like the MOTU Audio Setup icon to appear in the application dock as soon as a MOTU interface is detected (powered on, plugged in, etc.)

**Edit Channel Names**

Click the *Edit Channel Names* button to open the Channel Names window (Figure 5-3). This window lets you edit the names of the 896mk3 inputs and outputs, as they appear in your host audio software. For example, when you click on a menu that displays the 896mk3 inputs (or outputs), you will see the names you specify in this window (e.g. “vocal mic”, “lead guitar”, etc.), instead of the default generic names (“Analog 1”, “Analog 2”, etc.)

☛ Not all Mac OS X audio software supports channel names. If not, you’ll see generic port names in your host audio software.
CHAPTER 6  Front Panel Operation

OVERVIEW
The 896mk3 Hybrid offers complete front-panel programming via six rotary encoders and a 2x16 backlit LCD display. All 896mk3 settings can be accessed via these front-panel controls.

ANALOG INPUT CONTROLS
The 896mk3 front panel analog input controls (Figure 6-1) allow you to work with a wide variety of recording situations.

For information about connections and settings, see “Analog inputs” on page 23 in the installation chapter.

For information about the many settings available for the mic/guitar inputs, see:
- “The Inputs tab” on page 79
- “The channel settings section” on page 83
- “The Channel tab” on page 83
- “The EQ tab” on page 85
- “The Dynamics tab” on page 92

Figure 6-1: The 896mk3 Hybrid front panel mic/instrument input controls.
MASTER VOL AND “(MAIN OUT)” PHONE JACK
The phone jack labeled (MAIN OUT) (Figure 6-1) is a standard quarter-inch stereo headphone jack. Its output is hard-wired to mirror the XLR main outs on the rear panel. From the factory, the MASTER VOL knob above it controls the main outs and this jack, but MASTER VOL can be programmed to control any combination of outputs. See “The Monitor Group” on page 96 for details. Push the knob once to view the current volume setting in the LCD display; push it again to mute the monitor group; push a third time to return to the previous volume.

Note that if the Monitor Group is programmed to not include the main outs, the MASTER VOL knob will no longer control the volume of the phone jack, either.

PHONES
From the factory, the PHONES jack (Figure 6-2) is a discrete output at 44.1/48 kHz, but it can mirror any other output pair (digital or analog) or serve as its own independent output. For example, at 88.2/96 kHz, it defaults to mirroring the XLR main outs. At 176.4/192 kHz, it defaults to mirroring analog outs 1-2.

As the primary phone jack, it has its own dedicated volume knob.

The LCD provides detailed feedback as you turn the knob (Figure 6-7). To view the current setting without changing it, just push the knob (without turning it).

If you would like the (MAIN OUT) phone jack and the PHONES jack to output the same signal, assign the PHONES output to mirror the main outs. In this configuration, both the MASTER VOL and the PHONES volume knobs control the PHONES volume.

ANALOG INPUT METERS WITH V-LIMIT™ COMPRESSOR
All eight inputs are equipped with V-Limit™, a hardware limiter. With the limiter turned off, signals that hit zero or above will clip (a hard digital clip). However, with V-Limit enabled, signals can go as high as +12 dB above zero with no digital clipping. If the signal then goes above +12 dB, it will clip, even with V-Limit engaged. In either case, the clip LED (above +12) will illuminate.

Two input level scales
To accommodate these two scenarios, the eight analog input meters (Figure 6-3) are labeled with two different input level scales: from -42 to -1 (when V-Limit is disabled) and -42 to +12 dB (when V-Limit is engaged).

For further information about V-Limit, as well as another feature called Soft Clip, see “Overload protection” on page 84.

CLIP and HOLD LEDs
The CLIP and HOLD LEDs indicate when clipping has occurred (either with or without V-Limit). You can set the amount of time for the HOLD LED. See “Clip Hold Time” on page 46.
PROGRAMMABLE METERS

The programmable meter bank (Figure 6-4) lets you view the levels of any input or output bank (except analog input, which has its own bank): Analog Out, Optical A In, Optical A Out, Optical B In, Optical B Out, or Digital In/Out. This last option displays AES/EBU input, S/PDIF input, AES/EBU output and S/PDIF output, in order from left to right, as shown below.

Choose the desired bank by turning the METERS knob on the 896mk3 front panel (Figure 6-5). The current bank is indicated by the LEDs to the right of the programmable meter bank (Figure 6-4). You can also push the METERS knob to view the currently selected bank in the LCD.

You can also specify the bank in MOTU Audio Setup. See “Programmable Meters” on page 46.

MULTI-FUNCTION LCD DISPLAY

The multi-function LCD (Figure 6-6) provides access to the many 896mk3 settings, as well as visual feedback of the current parameter being modified.

Parameter “zooming”

For many settings, the LCD temporarily “zooms in” to display a long-throw meter and alphanumeric display to give you precise, real-time feedback as you adjust the setting. For example, if you change the headphone volume, the LCD will display a level meter and gain reduction reading that updates as you turn the volume knob (Figure 6-7). After a brief time-out, the display returns to its previous state before you turned the volume knob.

Three global menus

Push the PARAM knob (Figure 6-6) to cycle the LCD among three global menus, described in the rest of this chapter:

- 896mk3 SETUP
- AUDIO (settings)
- CUEMIX (mixer)

PUSH-BUTTON ROTARY ENCODERS

All of the knobs shown in Figure 6-6 are push-button digital rotary encoders. In many cases, you can either push the knob or turn it to make a setting or toggle the LCD display (depending on the encoder and setting).
896MK3 SETUP MENU
To access the 896mk3 SETUP menu, push the PARAM knob until you see 896mk3 SETUP displayed in the LCD. This menu provides basic features for managing the 896mk3 hardware. Turn the PARAM knob to access each setting, explained briefly below.

LCD Contrast
Turn the VALUE knob to adjust the LCD contrast.

Save/Name Preset
An 896mk3 preset holds all current CueMix FX mix settings (everything in the CUEMIX menu). SETUP menu and AUDIO menu parameters are not included. Turn the VALUE knob to move from character to character in the preset name. Turn PAGE to change the currently flashing letter. Once you've named the preset, push VALUE to save it, turn it again to choose the desired preset slot you wish to save it to (1-16), and then push again to confirm the save. Cancel the save operation at any time by turning the PARAM knob.

Load Preset
Turn VALUE to choose the preset you wish to load (1-16) and push VALUE to load it.

AutoSave Status
All of the parameters in the 896mk3 are periodically saved automatically in its memory, so that if you power down the unit, it will power back
up in the same state. AutoSave Status tells you the current state of this process: Change Detected, Saving… or Saved. If it says Saved, it is ready to be powered down. If it says Change Detected or Saving…, wait until it changes to Saved.

**Interface mode**

Turn VALUE to choose between FireWire or USB operation. Normally, the 896mk3 detects how it is connected to the host computer, but this setting lets you manually specify which bus to use.

**Factory Defaults**

Push VALUE to restore the 896mk3 hardware to its factory default settings. Push VALUE again to confirm, or turn PARAM to cancel.

**AUDIO MENU**

To access the AUDIO menu, push the PARAM knob until you see AUDIO displayed in the LCD. This menu provides basic settings such as sample rate, clock source, optical bank format (ADAT versus TOSLINK), and so on. These settings have corresponding settings in the MOTU Audio Setup software, as shown below:

<table>

* If the 896mk3 is currently connected to a computer, this setting cannot be changed from the front-panel LCD. It must be changed in MOTU Audio Setup instead. Or, you can disconnect the 896mk3 from the computer to change the Clock Source from the front panel.

**ADAT SMUX Type**

When the 896mk3 is operating at either 88.2 or 96 kHz, the AUDIO menu includes an item called **ADAT SMUX Type**.

This setting lets you configure the optical ports for ADAT format operation at the 2x sample rates only (88.2 or 96 kHz).

There are two choices:

- Type I — for 2x optical connection to 3rd-party SMUX-compatible hardware products
- Type II — for 2x optical connection to MOTU products that are equipped with optical ports and support 2x operation

Turn the VALUE knob to select an optical port and push the knob to toggle between the Type I and Type II setting.

**CUEMIX MENU**

To access the CUEMIX menu, push the PARAM knob until you see CUEMIX displayed in the LCD. This menu displays the settings for the 896mk3 CueMix FX mixer.

**CueMix mixer basics**

It is much easier to navigate the CUEMIX menu in the LCD if you have a general understanding of the CueMix FX mixer. We strongly recommend that you review chapter 9, “CueMix FX” (page 73) before learning the LCD, especially “CueMix FX basic operation” on page 75.

**CUEMIX menu organization**

Mixer settings are divided into four sub-menus, which correspond to the Inputs, Mixes, Outputs and Reverb tabs in the CueMix FX software:

- IN (inputs)
OUT (outputs)
- MIX (Mixes)
- REVERB (reverb processor)

Navigating the four main menus
To access the four main menus above, push the CHANNEL knob repeatedly. Then turn the CHANNEL knob to select the desired channel or mix.

The IN (inputs) menu
Push the CHANNEL button repeatedly until you see “I:” in the channel section of the LCD (Figure 6-9). This is similar to accessing the Inputs menu in CueMix FX console (“The Inputs tab” on page 79).

Choosing a channel
Once you see the Inputs menu (Figure 6-9) in the LCD, turn the CHANNEL knob to select the desired input that you wish to edit. This is roughly equivalent to specifying an input channel strip to work with in the Inputs tab in CueMix FX software (Figure 9-3 on page 79).

Choosing a setting to modify
Once you’ve selected an input channel, you can access the various settings for that channel using the PAGE knob and PARAMETER knobs.

Turn the PAGE knob to scroll through channel settings such as individual bands of EQ, the compressor, reverb sends, etc. Push the PAGE knob to jump to the next “section” of parameters or to jump back to the beginning of the list. This is roughly the equivalent of moving through the various channel controls in an individual input channel strip in CueMix FX (Figure 9-3 on page 79), as well as the settings in the Channel tab (Figure 9-8 on page 83).

Turn the PARAMETER knob to scroll through individual parameters, such as the frequency for the current band of EQ. This is roughly equivalent to the parameters in the EQ tab (Figure 9-10 on page 85), Dynamics tab (Figure 9-21 on page 92) and Reverb tab (Figure 9-23 on page 95) in the CueMix FX software.

Adjusting the value of a parameter
Turn the VALUE knob to adjust the value of the current PARAMETER. Some parameters have default values. If so, push the VALUE knob to cycle through them.

Inactive items
If a menu item is inactive for some reason (perhaps it doesn’t currently apply or it is disabled), it is displayed in parentheses.

Copying and pasting
EQ, dynamics and Mix Assign settings allow you to copy and paste settings between EQ bands and/or channels. Push the VALUE knob to copy, scroll to the other item and then push again to paste.

Summary of Inputs menu settings
For a summary of Inputs menu settings, see “Inputs menu” on page 57.
The OUT (Outputs) menu
Push the CHANNEL button repeatedly until you see “O:” in the channel section of the LCD (Figure 6-10). This is similar to accessing the Outputs tab in CueMix FX console (“The Outputs tab” on page 81).

Choosing a channel
Once you see the Outputs menu (Figure 6-10) in the LCD, turn the CHANNEL knob to select the desired output that you wish to edit. This is roughly equivalent to specifying an output channel strip to work with in the Outputs tab in CueMix FX software (Figure 9-6 on page 82).

Working with outputs in the LCD
Once you’ve selected an output channel, you can access the various settings for that channel using the PAGE knob and PARAMETER knobs. The knobs function the same as described for inputs in “Choosing a setting to modify” on page 54 and “Adjusting the value of a parameter” on page 54.

Summary of Output menu settings
For a summary of Inputs menu settings, see “Outputs menu” on page 57.

The MIX (Mixes) menu
Push the CHANNEL button repeatedly until you see “MIX 1” (or “MIX 2”, etc.) in the channel section of the LCD (Figure 6-11). This is similar to accessing the Mixes tab in CueMix FX console (“The Mixes tab” on page 77).

Choosing a mix bus
Once you see the MIX menu (Figure 6-11) in the LCD, turn the CHANNEL knob to select the desired mix that you wish to edit. This is roughly equivalent to choosing a mix in the Mixes tab in CueMix FX software (Figure 9-2 on page 77).

Working with mix busses in the LCD
Once you’ve selected a mix, you can access the various settings for that mix using the PAGE knob and PARAMETER knobs. The knobs function the same as described for inputs in “Choosing a setting to modify” on page 54 and “Adjusting the value of a parameter” on page 54. The PAGE knob scrolls through the following mix bus settings:

- MASTER — these are master fader settings, such as the master fader output assignment, master mute on/off, and the master fader volume. Access them with the PARAMETER knob.
REVERB — these are the reverb send and return controls for the bus master fader. Access them with the PARAMETER knob. Note: if the reverb processor is currently disabled, reverb is displayed in parentheses. If you are running the 896mk3 at 88.2 kHz or higher, the Reverb processor is disabled, and therefore the REVERB setting does not appear in the LCD as an option.

Individual channels — once you scroll past MASTER and REVERB, the PAGE knob then scrolls through all available inputs for the mix bus. Once you choose an input, access its channel settings using the PARAM knob and VALUE knob.

Summary of Mix menu settings
For a summary of Mix menu settings, see “Mixes menu” on page 58.

The REVERB menu
Push the CHANNEL button repeatedly until you see “REVERB” in the channel section of the LCD (Figure 6-12). This is similar to accessing the Reverb tab in CueMix FX (“The Reverb tab” on page 95).

The REVERB processor is not available at sample rates above 48 kHz. Therefore, when the 896mk3 is operating at 88.2 kHz or higher, the REVERB menu does not appear in the LCD.

Working with reverb settings in the LCD
Once you’ve selected the REVERB menu, you can access all settings using the PARAMETER and VALUE knobs. The PAGE knob is not needed and is therefore disabled when editing reverb settings.

Summary of Reverb menu settings
For a summary of Reverb menu settings, see “Reverb menu” on page 58.

### STAND-ALONE OPERATION

All settings, including all mix settings and global settings, are saved in the 896mk3’s memory, and they remain in effect even when the 896mk3 is not connected to a computer. This allows you to use the 896mk3 as a stand-alone 8-bus mixer. You can make adjustments to any setting at any time from the front panel.
CHAPTER 7 Configuring Host Audio Software

OVERVIEW
The 896mk3 Hybrid provides multi-channel audio input and output for Core Audio-compatible audio applications, including MOTU’s Digital Performer and AudioDesk, Apple’s Logic Pro, Logic Express, SoundTrack Pro, and GarageBand, and other third-party software applications such as Ableton Live, Avid Pro Tools, Cockos Reaper, Propellerhead Reason and Record, Steinberg Cubase and Nuendo, and others.

AudioDesk is included with your 896mk3 system. For complete information about all of AudioDesk’s powerful workstation features, refer to the AudioDesk User Guide included with your 896mk3 system.

Digital Performer, MOTU’s state-of-the-art digital audio workstation software, is available separately; for details about upgrading from AudioDesk to Digital Performer, talk to your authorized MOTU dealer or visit MOTU.com.

PREPARATION
To make sure that everything is ready for your host audio software, install your host audio software first (if you haven’t already done so), and then see these chapters before proceeding:

■ chapter 3, “Installing the 896mk3 Software” (page 19)

chapter 4, “Installing the 896mk3 Hardware” (page 21).

RUN MOTU AUDIO SETUP
Before you run your host audio software, launch MOTU Audio Setup to configure your 896mk3 hardware.

MOTU Audio Setup provides settings to configure your audio interface and enable the desired inputs and outputs. Only enabled inputs and outputs will be available to your software, so this is an important step. For complete details see chapter 5, “MOTU Audio Setup” (page 41).
CONFIGURING HOST AUDIO SOFTWARE

For complete details about the 896mk3 settings, see chapter 5, "MOTU Audio Setup" (page 41). The following sections provide a brief explanation of each 896mk3 setting.

Sample rate
Choose the desired overall sample rate for the 896mk3 system and your host audio software. Newly recorded audio will have this sample rate.

Clock Source
This setting is very important because it determines which audio clock the 896mk3 will follow.

If you do not have any digital audio connections to your 896mk3 (you are using the analog inputs and outputs only), and you will not be slaving your host software to external SMPTE time code, choose Internal.

If you have digital audio devices connected to the 896mk3, or if you are not sure about the clock source of your setup, be sure to read “Making sync connections” on page 28 and “Clock Source” on page 43.

If you are slaving the 896mk3 and your host software to SMPTE time code, follow the directions in “Syncing to SMPTE time code” on page 34.

Phones Assign
This 896mk3 setting lets you choose what you’ll hear from the headphone jack. For example, if you choose Main Out 1-2, the headphones will duplicate the main outs. Or you can choose any other output pair. If you choose Phones 1-2, this setting makes the headphone jack serve as its own independent output pair. As a result, you’ll see Phones 1-2 as an additional audio destination in your host’s audio output menus. When operating at high sample rates, the phones must mirror one of the other output pairs.

Optical input and output
To make a 896mk3 optical input or output available in your host software, choose the appropriate format (ADAT optical or TOSLINK) from the optical input and/or output menu. If you won’t be using the optical connectors, turn them off.

Main Outs Assign
Use the Main Outs Assign setting to determine what audio you will hear on the XLR main outs of the 896mk3. If you would like to treat them as their own separate output pair, choose Main Outs.

Return Assign
In your host audio software audio input menus, you’ll see an 896mk3 input called Return 1-2. This is a stereo feed from the 896mk3 that matches the signal of one of its output pairs. Use the Return Assign menu in MOTU Audio Setup to choose which output pair you would like to hear on this return. This can be used, for example, to record back a final stereo mix that includes effects processing from the 896mk3 DSP (such as the Leveler) for reference and archiving purposes.

Warning: the Return inputs can cause feedback loops! DO NOT assign this input to a track that shares the same 896mk3 output pair as the returns.

Reverb return
The 896mk3 also supplies a return to your host software that carries the output of its reverb processor. This return can be used for any purpose you wish.

CHOOSING THE MOTU AUDIO DRIVER

Once you’ve made the preparations described so far in this chapter, you’re ready to run your audio software and enable the MOTU Audio driver. Check the audio system or audio hardware configuration window in your software. There will
be a menu there that lets you choose among various drivers that may be in your system. Choose the MOTU Audio driver from this menu.

**Digital Performer and AudioDesk**

In MOTU Digital Performer or AudioDesk, choose Configure Audio System > Configure Hardware Driver from the Setup menu, as shown in Figure 7-2. Choose the MOTU 896mk3 Hybrid from the list of drivers.

![Figure 7-2: Enabling the 896mk3 Hybrid in Digital Performer](image.png)

**Pro Tools**

In Avid Pro Tools, go to the Setup menu and choose Playback Engine as shown in Figure 7-3. Choose the MOTU 896mk3 Hybrid from the Current Engine menu. For information about the H/W Buffer Size setting, see “Adjusting the audio I/O buffer” on page 69.

Pro Tools 9 or later is required for operation with the 896mk3 Hybrid.

![Figure 7-3: Enabling the 896mk3 Hybrid in Pro Tools](image.png)

**Logic Pro and Logic Express**

In Logic Pro and Logic Express, go to the Preferences window, click the Audio tab, click the Devices tab and click the Core Audio tab as shown in Figure 7-4. Choose the MOTU 896mk3 Hybrid from the Output and Input device menus.

![Figure 7-4: Enabling the 896mk3 Hybrid in Logic](image.png)
Soundtrack Pro
In Soundtrack Pro, access the preferences window, click the Recording tab and choose MOTU 896mk3 Hybrid from the Input and Monitor menu as shown below in Figure 7-5.

Garage Band
In Garage Band, go to the Audio/MIDI preferences and choose MOTU 896mk3 Hybrid from the Audio Output and Audio Input menus as shown below in Figure 7-6.

Cubase and Nuendo
In Cubase or Nuendo, go to the Device Setup window. Click the VST Audio System item in the Devices list and choose MOTU 896mk3 Hybrid from the ASIO Driver menu as shown below in Figure 7-7. Activate the inputs and outputs within Cubase or Nuendo as usual.

Live
In Ableton Live, access the preferences window and click the Audio tab. Choose Core Audio from the Driver Type menu. Choose the MOTU 896mk3 Hybrid from the Input Audio Device and Output Audio Device menus as shown below in Figure 7-8. To enable or disable input or output channels, click the Input Config or Output Config buttons.
Reason and Record
In Propellerhead Reason or Record, go to the Preferences window, choose Audio preferences from the menu and choose MOTU 896mk3 Hybrid from the Audio Output menu as shown below in Figure 7-9.

![Figure 7-9: Enabling the 896mk3 Hybrid in Reason](image)

Reaper
In Cockos Reaper, access the Preferences and click Devices under the Audio preferences. Choose MOTU 896mk3 Hybrid from the Audio Device menu as shown below in Figure 7-10.

![Figure 7-10: Enabling the 896mk3 Hybrid in Reaper](image)

Other audio software
For other audio applications, the procedure is similar to that shown above. Consult your owner’s manual for further information.

REDUCING LATENCY
On Mac OS X, audio I/O buffer size is handled by the host audio application rather than the 896mk3 Hybrid Core Audio driver.

Most audio software applications provide an adjustable audio buffer setting that lets you control the amount of delay you’ll hear when monitoring live inputs through your host audio software or processing them with software plug-ins.

For information, see the “Adjusting the audio I/O buffer” section of chapter 8, “Reducing Monitoring Latency” (page 67).

WORKING WITH 896MK3 INPUTS AND OUTPUTS
Once you’ve enabled the 896mk3 Hybrid’s driver, 896mk3 Hybrid audio inputs and outputs will appear in your host software wherever audio inputs and outputs are listed. If you don’t see the optical inputs and/or outputs, check MOTU Audio Setup to make sure they are turned on. If you don’t plan to use either optical bank, turn it off to conserve computer bandwidth.

Remember that the main outs and headphone output can be configured in MOTU Audio Setup to mirror other outputs. In addition, the 896mk3 Hybrid optical banks can be disabled or configured as either ADAT optical or TOSLink. This will affect how they appear (and if they appear at all) in your host software’s audio input lists. See “Optical input/output” on page 45, “Phones Assign” on page 45 and “Main Out Assign” on page 45.

AUDIO INPUT AND OUTPUT NAMES
The MOTU Audio driver supplies text string labels for the 896mk3 Hybrid’s audio inputs and outputs to clearly identify each one, but some applications do not display these labels.
For information on how you can identify each input and output in a numbered list like this, see Appendix A, "Audio I/O reference" page (127).

**NUMBER OF CHANNELS**  
If your host audio software requires that you specify the number of audio voices or channels you will be using, be sure to choose enough channels to cover the 28 inputs and 32 outputs provided by your 896mk3 Hybrid — although the number of channels may depend on how your 896mk3 Hybrid is configured.

**PROCESSING LIVE INPUTS WITH HOST PLUG-INS**  
If you patch a live input (such as a MIDI synthesizer) through a plug-in effect in your host software, you might hear a slight delay. There are several ways to reduce this delay. For details, see chapter 8, "Reducing Monitoring Latency" (page 67).

**WORKING WITH CUERMIX FX MIXING AND EFFECTS**  
The 896mk3 Hybrid provides powerful external mixing, EQ, compression and reverb, which you can operate hand-in-hand with your host’s mixing environment. For example, the 896mk3 Hybrid can serve as a monitor mixer routing channels to musicians, or it can serve as an integrated extension of your host’s mixing environment. If you program an 896mk3 Hybrid mixing and processing configuration that goes hand in hand with your host project, be sure to use the file save features in CueMix FX to save the 896mk3 Hybrid settings as a file in your host project folder for instant recall of all settings. See chapter 9, “CueMix FX” (page 73) for complete details.

**Synchronization**  
As you read through the following sections to decide what form of synchronization you might need with other devices in your studio, be sure to consult “Making sync connections” on page 28 for the proper hardware connections. Use the synchronization diagrams to be clear about how you will be synchronizing your audio software and the 896mk3 Hybrid to the other components of your system.

**Synchronizing digital audio connections**  
If you have devices connected to the 896mk3 Hybrid digital inputs (optical or RCA S/PDIF), you need to be concerned with the synchronization of the 896mk3 Hybrid’s digital audio clock with other devices connected to it digitally (if any). For example, if you have a digital mixer connected to the 896mk3 Hybrid via an ADAT optical light pipe cable, you need to make sure that their audio clocks are phase-locked. For details, see “Choosing a clock source for optical connections” on page 25 and “Making sync connections” on page 28. If you don’t have any digital audio devices connected to the 896mk3 Hybrid, digital audio phase-lock does not apply to you.

**Resolving directly to time code (with no synchronizer)**  
If your host audio software supports Core Audio’s sample-accurate positioning protocol, or if it can slave to MIDI Time Code, then it can resolve to the 896mk3 Hybrid’s built-in time code synchronization feature. To resolve your 896mk3 Hybrid directly to SMPTE time code with no additional synchronization devices, use the setup shown in “Syncing to SMPTE time code” on page 34.

**Using a Foot Switch**  
Use a foot switch connected to the 896mk3 Hybrid to trigger recording punch-in and punch-out, or any other feature in your host audio software that is assigned to a keyboard shortcut.

By default, the foot switch triggers the 3 key on the keyboard number pad (which toggles the record button in Digital Performer and AudioDesk). To
configure the keystrokes triggered by the foot switch, visit MOTU Audio Setup. (See “Enable Pedal” on page 47.)

24-BIT OPERATION
Your 896mk3 hardware fully supports 24-bit recording capabilities in any audio software that supports it. Simply enable 24-bit operation as instructed by the software. The 896mk3 Hybrid always supplies the software a 24-bit data stream, and when you enable 24-bit operation, it simply uses all 24-bits supplied by the 896mk3 Hybrid hardware.
CHAPTER 8  Reducing Monitoring Latency

OVERVIEW

Monitoring latency is that slight delay you hear when you run an input signal through your host audio software. For example, you might hear it when you drive a live guitar input signal through an amp modeling plug-in running in your audio sequencer.

This delay is caused by the amount of time it takes for audio to make the entire round trip through your computer, from when it first enters an 896mk3 input, passes through the 896mk3 hardware into the computer, through your host audio software, and then back out to an 896mk3 output.

If you don’t need to process a live input with plug-ins, the easiest way to avoid monitoring latency is to use the 896mk3’s CueMix FX digital mixer to patch the input directly to your monitor outs via the 896mk3 audio hardware. The 896mk3 even provides effects processing (EQ, compression and reverb), which can be applied on input, output, or even at the bussing stage, just like a conventional mixer. For details, see “CueMix FX hardware monitoring” on page 71.

If you do need to process a live input with host software plug-ins, or if you are playing virtual instruments live through your 896mk3 audio hardware, you can significantly reduce latency — and even make it completely inaudible, regardless of what host audio application software you use. This chapter explains how.

It is important to note that monitoring delay has no effect on when audio data is recorded to disk or played back from disk. Actual recording and playback is extremely precise.
MONITORING LIVE INPUT

There are two ways to monitor live audio input with an 896mk3: 1) through the computer or 2) via the 896mk3 CueMix FX hardware mixer. Figure 8-1 shows method 1, which allows you to apply host-based effects processing via plug-ins in your audio software. See the next section, “Adjusting the audio I/O buffer” for details about how to reduce — and possibly eliminate — the audible monitoring delay that the computer introduces.

Figure 8-2 shows how to use CueMix FX hardware-based monitoring, which lets you hear what you are recording with no monitoring delay and no computer-based effects processing. Instead, input is routed directly to an output, either with or without 896mk3-based effects processing (EQ, compression or reverb). See “CueMix FX hardware monitoring” later in this chapter for details on how to use CueMix FX with your audio software, or with the included CueMix FX software.

If the material you are recording is suitable, there is a third way to monitor live input: use both methods (Figure 8-1 and Figure 8-2) at the same time. For example, you could route guitar to both the computer (for an amp model effect) and mix that processed signal on the main outs with dry guitar from CueMix FX — or perhaps with a touch of 896mk3 Classic Reverb.

---

**Figure 8-1:** There are two ways to monitor live audio inputs with an 896mk3: 1) through the computer or 2) via CueMix FX hardware monitoring. This diagram shows method 1 (through the computer). When using this method, use your host software’s buffer setting to reduce the slight delay you hear when monitoring the live input, but don’t lower it too much, or your computer might get sluggish.
ADJUSTING THE AUDIO I/O BUFFER

A buffer is a small amount of computer memory used to hold data. For audio interfaces like the 896mk3, buffers are used for the process of transferring audio data in and out of the computer. The size of the buffers determines how much delay you hear when monitoring live inputs through your audio software: larger buffers produce more delay; smaller buffers produce less.

Under Mac OS X, audio I/O buffer size is handled by the host audio application (not the 896mk3 Core Audio driver). Most audio software applications provide an adjustable audio buffer setting that lets you control the amount of delay you’ll hear when monitoring live inputs or processing them with software plug-ins. Below are a few examples.

Figure 8-2: This diagram shows the signal flow when using CueMix FX no-latency monitoring. Notice that this method does not process the live input with plug-ins in your audio software. Instead, you can apply 896mk3 effects, such as the reverb, EQ and/or compression.

1. Live input (from mic, guitar, etc.) enters the MOTU interface.
2. CueMix FX immediately patches the live mic signal directly to the main outs (or other output), completely bypassing the computer. This signal could be dry or with 896mk3 effects processing, such as EQ, compression or Classic Reverb.
3. Mic signal is mixed with the main outs, and you can control the volume (relative to the rest of the mix) with the mic’s fader in CueMix FX.

Figure 8-3: In Digital Performer and AudioDesk, choose Setup menu> Configure Audio System> Configure Hardware Driver to open the dialog shown above and access the Buffer Size setting. Refer to your Digital Performer or AudioDesk manual for information about the Host Buffer Multiplier setting.
REDUCING MONITORING LATENCY

Figure 8-4: In Cubase or Nuendo, choose Devices menu > Device Setup. Select MOTU 896mk3 Hybrid, then click the Control Panel button to access the window above and the Buffer Size setting.

Figure 8-5: In Logic Pro or Logic Express, go to the Audio Devices preferences to access the Buffer Size option shown above.

Lower latency versus higher CPU overhead
The buffer setting has a large impact on the following things:

- Patch thru latency
- The load on your computer’s CPU
- Possible distortion at the smallest settings
- How responsive the transport controls are in AudioDesk, Digital Performer or other audio software

The buffer setting presents you with a trade-off between the processing power of your computer and the delay of live audio as it is being patched through your software. If you reduce the size, you reduce patch thru latency, but significantly increase the overall processing load on your computer, leaving less CPU bandwidth for things like real-time effects processing. On the other hand, if you increase the buffer size, you reduce the load on your computer, freeing up bandwidth for effects, mixing and other real-time operations.

Figure 8-6: When adjusting the buffer size to reduce monitoring latency, watch the ‘processor’ meter in Digital Performer or AudioDesk’s Performance Monitor. If you hear distortion, or if the Performance meter is peaking, try raising the buffer size.

If you are at a point in your recording project where you are not currently working with live, patched-thru material (e.g. you’re not recording vocals), or if you have a way of externally processing inputs, choose a higher buffer size. Depending on your computer’s CPU speed, you might find that settings in the middle work best (256 to 1024).

Transport responsiveness
Buffer size also impacts how quickly your audio software will respond when you begin playback, although not by amounts that are very noticeable. Lowering the buffer size will make your software respond faster; raising the buffer size will make it a little bit slower, but barely enough to notice.
Effects processing and automated mixing
Reducing latency with the buffer size setting has another benefit: it lets you route live inputs through the real-time effects processing and mix automation of your audio software.

CUEMIX FX HARDWARE MONITORING
The 896mk3 has a more direct method of patching audio through the system. This method employs the 896mk3’s CueMix FX digital mixer. When enabled, CueMix activates hardware patch-thru in the 896mk3 itself. CueMix FX has two important benefits:

- First, it completely eliminates the patch thru delay (reducing it to a small number of samples — about the same amount as one of today’s digital mixers).
- Secondly, CueMix FX imposes no strain on the computer.

The trade-off, however, is that CueMix FX bypasses your host audio software. Instead, live audio inputs are patched directly through to outputs in the 896mk3 itself and are mixed with disk tracks playing back from your audio software. This means that you cannot apply host-based plug-ins, mix automation, or other real-time effects that your audio software provides. But for inputs that don’t need these types of features, CueMix FX is the way to go.

On the other hand, if you really need to use the mixing and processing provided by your audio software, you should not use CueMix FX. Instead, reduce latency with the buffer setting (as explained earlier in this chapter).

TWO METHODS FOR CONTROLLING CUEMIX FX
There are two ways to control CueMix FX:

- With CueMix FX
- From within your host audio software (if it supports direct hardware monitoring)

You can even use both methods simultaneously.

Using CueMix FX
If your host audio software does not support direct hardware monitoring, you run the CueMix FX software side-by-side with your audio software and manage your monitor mix in CueMix FX.

CueMix FX allows you to create up to eight separate 896mk3 stereo mixes, or any other desired routing configurations. These routings are independent of your host audio software. For complete details, see chapter 9, “CueMix FX” (page 73).

Controlling CueMix FX from your audio software
Some audio applications allow you to control CueMix FX monitoring from within the application (without the need to use CueMix FX). In most cases, this support consists of patching an 896mk3 input directly to an output when you record-arm a track. Exactly how this is handled depends on the application.

The following applications are among those that support direct control over CueMix FX:

- Digital Performer
- AudioDesk

CueMix FX routings that are made via host applications are made “under the hood”, which means that you won’t see them in CueMix FX. However, CueMix FX connections made inside your host audio software dovetail with any other mixes you’ve set up in CueMix FX. For example, if your host application routes audio to an output pair that is already being used in CueMix FX for an entirely separate mix bus, both audio streams will simply be merged to the output.
Controlling CueMix FX from within AudioDesk or Digital Performer

To turn on CueMix FX in AudioDesk and Digital Performer:

1. From the Setup menu, choose Configure Audio System > Input Monitoring Mode.

2. Choose the Direct hardware playthrough option, as shown below in Figure 8-7.

3. From the Studio menu, choose Audio Patch Thru, and choose any monitoring mode except Off.

![Figure 8-7: Enabling CueMix FX in AudioDesk or Digital Performer.](image)

Once enabled, CueMix FX monitoring is tied with Digital Performer or AudioDesk’s Audio Patch Thru feature: when you record-enable a track, the track’s input is routed directly to its output (via CueMix FX in the 896mk3 hardware). For example, if you record-enable a track called guitar in your DP or AudioDesk project, and its audio input assignment is Analog in 2, and its audio output assignment is optical channels 7-8, CueMix FX no-latency hardware monitoring will automatically be set up from analog in 2 to optical outputs 7-8.

Controlling CueMix FX from within other software

Consult the manual for your software.
CHAPTER 9  **CueMix FX**

**OVERVIEW**
CueMix FX is a cross-platform software application that provides graphic, on-screen control for the 896mk3 Hybrid's flexible CueMix FX on-board mixer and effects processing.

CueMix FX can be used independently of host audio software, or together with it. CueMix dovetails with the direct monitoring features of your host audio software, allowing you to seemlessly mix in both environments.

For information about programming the 896mk3's on-board mixing and effects using the front panel LCD, see chapter 6, “Front Panel Operation” (page 49).
A 16-BUS MIXER WITH EQ, COMPRESSION AND REVERB
All 896mk3 inputs and outputs can be routed to the on-board CueMix FX 16-bus (8 stereo bus) digital mixer driven by hardware-based DSP with 32-bit floating point precision.

The CueMix FX mixer allows you to apply no-latency effects processing to inputs, outputs or busses directly in the 896mk3 hardware, independent of the computer. Effects can even be applied when the 896mk3 is operating stand-alone (without a computer) as a complete rack-mounted mixer. Input signals to the computer can be recorded wet, dry, or dry with a wet monitor mix (for musicians during recording, for example).

Effects include:

- Classic Reverb with tail lengths up to 60 seconds
- 7-band parametric EQ modeled after British analog console EQs
- A standard compressor with conventional threshold/ratio/attack/release/gain controls
- The Leveler™, an accurate model of the legendary LA-2A optical compressor, which provides vintage, musical automatic gain control

The 896mk3’s flexible effects architecture allows you to apply EQ and compression on every input and output (a total of 58 channels), with enough DSP resources for at least one band of parametric EQ and compression on every channel at 48 kHz. DSP resources are allocated dynamically and a DSP meter in the CueMix FX software allows you to keep tabs on the 896mk3’s processing resources.

Each input, output and mix bus provides a send to the Classic Reverb processor, which then feeds reverb returns to mix busses and outputs, with a selectable split point between them to prevent send/return feedback loops.

ADVANTAGES OVER HOST-BASED MIXING AND PROCESSING
CueMix FX provides several major advantages over mixing and processing in your host audio software:

- CueMix has no buffer latency. Thanks to the 896mk3’s DSP chip, CueMix provides the same throughput performance as a digital mixer.
- CueMix mixing and effects processing imposes no processor drain on the computer’s CPU.
- CueMix routing can be maintained independently of individual software applications or projects.
- CueMix routing can operate without the computer, allowing the 896mk3 to operate as a portable, stand-alone mixer with effects.
CUEMIX FX INSTALLATION

CueMix FX is installed with the rest of your 896mk3 software.

CUEMIX FX BASIC OPERATION

Here is a brief overview of the CueMix FX mixer.

Eight stereo mix busses

CueMix provides eight stereo mix busses: Bus 1, Bus 2, Bus 3, and so on. Each mix bus can take any number of inputs and mix them down to any 896mk3 output pair that you choose. For example, Bus 1 could go to the headphones, Bus 2 could go to the main outs, Bus 3 could go to a piece of outboard gear connected to analog outputs 7-8, etc.

Many inputs to one output pair

It might be useful to think of each mix bus as some number of inputs all mixed down to a stereo output pair. CueMix FX lets you choose which inputs to include in the mix, and it lets you specify the level, pan and other input-specific mix controls for each input being fed into the mix.

Viewing one mix bus at a time

CueMix FX displays one mix bus at a time in the Mixes tab (Figure 9-2 on page 77). To select which mix you are viewing, choose it from the mix bus menu (Figure 9-2). The mix name appears above the mix bus master fader (Figure 9-2), where you can click the name to change it.

---

Figure 9-1: CueMix FX is a virtual mixer that gives you control over the 896mk3’s on-board mixing features.
Each mix bus is independent
Each mix bus has its own settings. Settings for one bus will not affect another. For example, if an input is used for one bus, it will still be available for other busses. In addition, inputs can have a different volume, pan, mute and solo setting in each bus.

Input channels
The Inputs tab (Figure 9-3 on page 79) gives you access to settings for individual 896mk3 inputs (or input pairs), such as phase, trim, EQ and dynamics processing. Each input also includes a send to the 896mk3’s global reverb processor. These settings are applied to the signal before it goes anywhere else (to a mix bus or the computer).

Output channels
The Outputs tab (Figure 9-6 on page 82) gives you access to settings for each 896mk3 output pair, including EQ, dynamics processing and send/return controls for feeding and returning the output signal to/from the 896mk3’s global reverb processor. These settings are applied to the signal just before it is sent to the output.

Channel focus and settings
Click the focus button for a channel (Figure 9-1) to view channel-specific parameters in the Channel Settings section of the CueMix FX window (Figure 9-1). Separate tabs are provided for channel-specific settings (channel strip, EQ and dynamics), plus the global meter bridge and reverb processor.

Global reverb processor
The 896mk3 has a global reverb module (Figure 9-23 on page 95). Once it has been activated, you can feed signals to the reverb processor from various points in the 896mk3 mix matrix via input sends, bus sends and output sends. Stereo output from the reverb processor can then be fed back to mix busses or output pairs using reverb returns.

Other features
CueMix offers many additional features, discussed in this chapter, such as talkback/listenback, extensive metering, graphic editing of certain effects parameters, monitor grouping and more.

Widening the CueMix FX window
To view more input faders at once, drag the grow box (Figure 9-1) to the right.
THE MIXES TAB
Click the Mixes tab (Figure 9-2) to gain access to the 896mk3's eight stereo mix busses. The Mixes tab displays one mix bus at a time.

Viewing a mix
Choose the mix you wish to view from the mix bus menu (in the Mixes tab itself, as shown in Figure 9-2). The menu shows all mixes by name, followed by the 896mk3 output pair to which each bus master fader is currently assigned, if any.

Naming a mix
Click the mix name at the top of the mix bus master fader (Figure 9-2) to edit the name.

Assigning a mix bus output
Choose the desired output pair for the mix bus from the bus output menu (Figure 9-2). The bus output menu displays all current available (enabled) 896mk3 output pairs. If a bus is already assigned to an output pair, the bus name appears next to the output pair name to indicate that the output pair is already taken by a bus. Only one bus can be assigned to any given output pair. If you choose an output already assigned to another bus, that bus output will become disabled.

Bus fader
The bus fader (Figure 9-2) controls the overall level of the mix (its volume on its stereo output). Use the individual input faders to the left to control individual input levels.

Figure 9-2: The Mixes tab.
Bus mute
The bus mute button (Figure 9-2) disables (silences) the mix.

Bus level meter
The bus level meter, which is post-fader, shows you the output for the mix's output.

Bus reverb send/return
The bus reverb send (Figure 9-2) feeds the output of the mix bus, pre-fader, to the 896mk3’s global reverb processor, where it is merged with any other signals being fed to the reverb. The reverb's output can then be fed back into the mixer at various return points, including the bus return (discussed below).

The bus reverb return (Figure 9-2) feeds the output of the 896mk3’s global reverb processor into the mix bus, pre-fader. This includes any other signals currently being fed to the reverb. The bus reverb return is disabled (grayed out) when the reverb Split Point is set to Output to eliminate the possibility for feedback loops created by reverb send/return loops. See "Split point" on page 95.

Input section
The horizontally scrolling area in the Mix tab to the left of the master fader (Figure 9-2) displays channel strips for all currently enabled 896mk3 inputs.

Naming an input
Click the input name at the top of the input channel strip (Figure 9-2) to edit the name. Input names are global across all mixes. This name also appears in host audio software on the computer (if the software supports channel names).

Input channel focus
Click the channel focus button (Figure 9-3) to view and edit parameters in the channel settings section of the CueMix FX window (Figure 9-7 on page 83). Clicking the mix bus master fader focus button brings the assigned output into focus, if there is one. Channel focus also determines which channels are being scoped by CueMix’s audio analysis tools, as explained in “Choosing channels for audio analysis” on page 100.

Input fader and mute/solo
To add an input to a mix, or remove it, click its Mute button. To solo it, use its Solo button. Use the input fader (Figure 9-2) to adjust the level for the input in the mix. Note that an input can have different level, pan, mute and solo settings for different mixes. Input channel level meters are post-fader.

If any solo button on the current (active) bus is enabled, the Solo Light (Figure 9-1) will illuminate.
The 896mk3 provides many features for managing analog and digital input signals. Some of these features, such as the 896mk3’s digitally controlled analog trims, are implemented in the analog domain; others are implemented in the digital domain as DSP applied to the digital signal (after the A/D converter on analog inputs). Click the Inputs tab (Figure 9-3) to access and control all of these input channel settings for each 896mk3 input or input pair.

**Input tab settings are global**
Except for the reverb send, all settings you make in the Input tab are applied to the input signal before it goes anywhere else (to a mix bus or the computer). For example, if you apply EQ and compression to the input signal, you will record the processed version of the signal in your host audio software running on the computer. If you need to record a completely unprocessed input signal, do not apply any changes to it in the Input tab. The only exception to this is the reverb send, which simply splits the input signal and feeds a copy of it to the 896mk3’s reverb processor.

**Signal flows from top to bottom**
Settings in each Input tab channel strip are generally applied to the signal in order from top to bottom. Input channel signal flow is as follows: front-panel trim, overload protection, phase, stereo versus M/S decoding, width, L/R swap, EQ, dynamics and reverb send.

**Input name**
Click the input name at the top of the input channel strip (Figure 9-3) to edit the name. Input names are global across all mixes. This name also appears in host audio software running on the computer (if the software supports channel names).

Input channel focus
Click the channel focus button (Figure 9-3) to view and edit parameters in the channel settings section of the CueMix FX window (Figure 9-7 on page 83).

Mono/stereo pairing
Click the Mono button (Figure 9-3) if you would like an input to be treated as a mono channel. If you would like to work with it as one channel of a linked stereo pair, click the Stereo button. Inputs are grouped in odd/even pairs (mic 1-2, Analog 1-2, 3-4, etc.) Stereo pairs appear as a single channel strip in the CueMix FX mixer (in all tabs).

Invert phase
Click the Phase button (Figure 9-3) to invert the phase of the input signal. For stereo pairs, you can invert the phase for the left and right channels independently.

Input trim
All 896mk3 inputs, both analog and digital, offer continuously variable input trim. In all cases, trim level can be controlled digitally in 1 dB increments. This includes the digitally controlled analog trims on the eight analog inputs. Here is a summary of input trim ranges for each type of 896mk3 input:

<table>
<thead>
<tr>
<th>Input</th>

Once you adjust the trim levels, you can save them as a file on disk for future instant recall. See “Saving and loading hardware presets” on page 99 and “Configurations menu” on page 117.

Input EQ and dynamics
The 896mk3 lets you apply 7-band parametric EQ and dynamics processing (DSP) to any input, analog or digital.

The controls in the EQ/Compression section of the Inputs tab (Figure 9-3) let you edit EQ and compression settings within the context of the channel strip. This is ideal when you are comparing settings among neighboring channels, or perhaps even applying the same setting across all inputs. However, for more detailed editing of EQ and compression settings for an input channel, you can click its Focus button and view the settings in the Channel Section of the CueMix FX window (Figure 9-1). This section even provides graphical editing of EQ curves and the compressor graph, allowing you to click and drag directly on the graphic. For details see “The channel settings section” on page 83.

The EQ/Dynamics graph
The EQ/Dynamics graph for each input channel strip (Figure 9-3) provides a thumbnail view of the EQ curves or Compressor graph for the channel. This graphic is for display purposes only; it cannot be edited directly. To change the EQ settings in this graph, use the two or three knobs below, as explained in the following sections. If, however, you would like to edit the EQ curves graphically, you can do so in the EQ tab (Figure 9-10 on page 85).

EQ/Dynamics selectors
The EQ/Dynamics selector buttons along the right-hand edge of the EQ/Dynamics section (Figure 9-3) allow you to choose what you are viewing and editing in the EQ/Dynamics section.
Click the selector (Figure 9-4) for the desired EQ band, low-pass (LP) filter, high pass (HP) filter or compressor to view it across all channels.

**Shortcut:** hold down the Option/Alt key while clicking an EQ selector button to show just that band of EQ in the graphs. Click any selector again to return to viewing all bands.

**Using the EQ/Dynamics knobs**

Once you have chosen the desired EQ band, or the compressor, you can modify its settings using the two or three knobs below the graph. The knobs match the color of the currently selected effect, to help remind you of which effect you are currently editing.

**Important:** before you can modify the settings of an EQ band using the three knobs below the graph, the EQ band must be enabled. This is done in the EQ tab (Figure 9-10), as explained in “Enabling EQ” on page 85.

**EQ/Dynamics enable/disable buttons**

Click the EQ or Dynamics button at the bottom of the input channel (Figure 9-3) to toggle the effect on or off. Note that you can program EQ and compressor settings, even when the effect is currently disabled. (You just won’t hear the result until you enable it.)

**Reverb send**

The input reverb send (Figure 9-3) feeds the input signal to the 896mk3’s global reverb processor, where it is merged with any other signals being fed to the reverb. The reverb’s output can then be fed back into a mix or output pair. The send occurs after all other settings in the input channel strip (phase invert, EQ, compression, etc.).

**THE OUTPUTS TAB**

The Outputs tab (Figure 9-6) lets you apply EQ, dynamics and reverb to any output pair, just before the signal leaves the 896mk3. This is processing that occurs at the very end of the signal flow, after everything else (host based effects, 896mk3 input or bus processing, mixing, and so on). Processing is done in the digital domain, just before the signal goes analog through the D/A converter. Output tab processing is applied to the entire output mix (all signals being mixed to the output from various sources).

**Signal flows from top to bottom**

Settings in each Output tab channel strip are applied to the signal in order from top to bottom. For example, EQ occurs before Dynamics, which is applied before the reverb send and return.

**Output name**

Click the output name at the top of the output channel strip (Figure 9-6) to edit the name. Output names are global and will also appear in host audio software on the computer (if the software supports channel names).
Output channel focus
Click the channel focus button (Figure 9-6) to view and edit parameters in the channel settings section of the CueMix FX window (Figure 9-7 on page 83). Channel focus also determines which channels are being scoped by CueMix’s audio analysis tools, as explained in “Choosing channels for audio analysis” on page 100.

Output EQ and Dynamics
The EQ/Dynamics section in the Outputs tab (Figure 9-6) works identically to the EQ/Dynamics section for the Inputs tab (Figure 9-3). See “Input EQ and dynamics” on page 80.

Output reverb send/return
The output reverb send (Figure 9-6) feeds the signal for the output to the 896mk3’s global reverb processor, where it is merged with any other signals being fed to the reverb. The reverb’s output can then be fed back into the mixer at various return points, including the same output from which it was sent (discussed below). The output reverb send is disabled (grayed out) when the reverb Split Point is set to Mix to eliminate the possibility for feedback loops created by reverb send/return loops. See “Split point” on page 95.

The output reverb return (Figure 9-6) feeds the output of the 896mk3’s global reverb processor directly to the output. This includes any other signals currently being fed to the reverb.

Both the send and return occur after EQ and dynamics processing, but before listenback and talkback.

Talkback/Listenback
Click the Talkback or Listenback buttons (Figure 9-6) to toggle whether the output pair is included in the Talkback or Listenback group. See “Talkback and listenback” on page 97.

Monitor group assign
Click the Monitor buttons (Figure 9-6) to toggle whether the output pair is included in the Monitor group. See “The Monitor Group” on page 96.
THE CHANNEL SETTINGS SECTION
The channel settings section in the CueMix FX window (Figure 9-1) displays three tabs for Channel, EQ and Dynamics settings for the channel with the current focus. There are also two global tabs: the Meter Bridge and the Reverb Processor, as shown below.

The Channel tab
The Channel tab (Figure 9-8) displays settings for input channels. Click any focus button in the Inputs tab to view the Channel tab settings for the channel.

Signal flow
Settings in the Channel tab occur just before the EQ, dynamics and reverb sends in the Input tab channel strip (Figure 9-3 on page 79). Input channel signal flow is as follows: trim, overload protection, phase, stereo versus M/S decoding, width, L/R swap, EQ, dynamics and reverb send.

Pad and phantom
The Pad and phantom settings become active (ungrayed) when the focus is on a mic input (or mic input pair). These are the same -20 dB pad and 48V phantom power settings that you can also control from the 896mk3 front panel TRIM encoders. There are separate settings for each mic input.
Stereo settings
Inputs that have been grouped as stereo pairs in the Inputs tab (Figure 9-3) provide two stereo modes (Figure 9-8): Normal and M/S. M/S mode provides decoding for a mid-side microphone configuration.

The Width knob (Figure 9-8) provides control over the stereo imaging, going from a full stereo image to mono (both channels panned equally). See “Width” on page 78.

The Swap L/R button (Figure 9-8) lets you switch the left and right channels.

Overload protection
The Overload Protection section (Figure 9-8) provides two features that help prevent digital clipping on the eight analog inputs.

V-Limit™ (Figure 9-8) is a hardware limiter that helps prevent digital clipping from overloaded input signals. With V-Limit engaged, signals can go above zero dB (with limiting applied) to as high as +12 dB above zero with no distortion due to digital clipping. Click the Lookahead option for even better protection against sharp transients.

Lookahead adds a 1.5 millisecond delay to the input signal. Therefore, when you enable lookahead for one or more inputs, all analog inputs (even ones without the limiter and lookahead enabled) are delayed together by 1.5 ms so that all eight inputs remain perfectly in phase with each other.

Additional or alternative protection can be applied by enabling Soft Clip (Figure 9-8). When enabled, Soft Clip engages just before clipping occurs and helps further reduce perceptible distortion. When V-Limit is turned off, Soft Clip begins to engage around -2 dB (just below zero); when V-Limit is turned on, Soft Clip begins to engage around +10 dB (just below +12 dB).

Talkback section
Click the Talkback or Listenback button (Figure 9-8) to toggle whether the input is the Talkback or Listenback input. Only one input can be the talkback input, and only one input can be the listenback input. See “Talkback and listenback” on page 97.

Reverb section
The Send in the reverb section (Figure 9-8) is the same control as the reverb send in the Input tab channel strip (Figure 9-3). See “Reverb send” on page 81. If the input is currently not grouped as a stereo pair in the Input tab (it is operating as a mono input), use the reverb Pan knob (Figure 9-8) to pan the mono signal for the stereo reverb processor.

Input meter and bus activity LEDs
When the Channel tab is active (Figure 9-8), the display above the tab provides a horizontal level meter and eight bus activity LEDs (Figure 9-9).

The input level meter (Figure 9-9) is the same as the input meters in the Meters tab (Figure 9-22 on page 94) with the Pre FX button engaged, which shows the input level on the physical input itself, before any processing of any kind occurs within the 896mk3. This meter gives you the most accurate reading of the actual signal level hitting the input, regardless of any other settings (such as V-Limit, Soft Clip and so on). The clip indicator, however, happens after V-Limit and/or Soft Clip. This allows you to see when clipping occurs, even with these overload protection features engaged.
The Bus Activity LEDs (Figure 9-9) show you which mix busses the input signal is being fed to. For example, LED #6 will glow under the following conditions: the input is unmuted in mix bus 6, its fader is up, and there is signal activity from the input going into the mix bus.

The EQ tab
The EQ tab (Figure 9-10) displays the EQ settings for the input or output channel that currently has the focus. Click any focus button in the Inputs or Outputs tab to view the EQ tab settings for the channel.

Vintage EQ
Inspired by legendary British large console EQs, the 896mk3 Vintage EQ section (Figure 9-10) gives you the look, feel and sound of the most sought-after classic equalizers. Five bands of center frequency parametric EQ filtering are provided, each with four EQ types that provide current popular EQ styles and vintage analog EQ styles alike. Two bands include shelf filtering. Two additional bands of variable slope low pass and high pass filtering are provided. The filter response display provides comprehensive control and visual feedback of the EQ curve being applied. With 64-bit floating point processing, the 896mk3 Vintage EQ has been carefully crafted and meticulously engineered to produce musical results in a wide variety of applications.

Enabling EQ
Each input and output channel has a global EQ enable/disable button (Figure 9-3 and Figure 9-6). This button enables or disables all bands of EQ for each channel.

Figure 9-10: The EQ tab.
the channel. In addition, each individual band of EQ has a Filter enable/disable switch (Figure 9-10), allowing you to enable as few or as many bands as needed for each individual channel.

**Vintage EQ Quick reference**

**Filter response display:** Shows the response curve for the current settings.

**Vertical scale:** Lets you zoom the vertical scale of the filter response display.

**Parameter display:** Shows the precise numbers of the parameter you are adjusting (or hovering over with the arrow cursor). The labels (frequency, gain, etc.) match the color of the filter being displayed. When a filter handle is not selected and when the cursor is not hovering over the display, the parameter display shows the name of the current channel being edited (the channel that currently has the focus), as shown below:

**EQ filter:** one of five center bands of EQ that can be independently enabled and programmed.

**Filter type:** Lets you choose from one of four or five EQ styles for each independent band of EQ.

**Low/High Pass filter:** Both a low pass and high pass filter are supplied with six different slope settings.

**Slope:** Lets you choose the slope (fall off) characteristics of the low pass and high pass filter.

**Q handle:** Drag the Q handle lines to graphically adjust the Q setting for the currently selected filter. To select the filter, click its filter handle.

**Filter handle:** Drag this handle to graphically adjust the filter’s boost/cut and/or frequency.

**Composite curve (white line):** shows the overall response curve of the current settings in the window.

**Individual filter curve:** Each filter has a color (indicated by its knobs). When filter curves are being displayed (the filter curve option is turned on), each individual filter’s response curve is displayed in the filter’s color.

**Filter display options menu:** Provides several options for controlling the filter display.

**Filter enable/disable:** Turns the filter on or off.

**How the vintage EQ works**

The Vintage EQ operates like a standard EQ filter, but with much more sophisticated processing algorithms “under the hood”. There are five bands of EQ, each with their own unique knob color, plus additional low pass and high pass filters. Each filter can be set to any center frequency you wish.

Each filter can be independently turned on or off with the enable/disable button (Figure 9-10). Each filter can be set to one of four different filter types (I, II, III or IV). The two top-most filters (orange and green) provide an extra low and high shelf setting, in addition to the four standard band settings. The additional low pass and high pass filters (lower left) have gray cutoff frequency knobs and six settings for slope (in octaves/dB).

**Frequency response display**

The frequency response display at the top of the window displays the response curve of the current settings in the window. The (horizontal) frequency range is from 10 hertz to 20 KHz. The (vertical)
amplitude scale is in dB and is adjustable between 3 and 24 dB using the vertical scale buttons (Figure 9-10).

**Showing and hiding filter curves**
To view a filter in the display, turn on the filter. The shape of the filter, according to its current settings, is shaded in the same color as the filter's knob(s). Use the filter display options menu (Figure 9-10) to show or hide them in the display.

**Adjusting filters in the display**
Each filter has a handle, displayed as shown below in Figure 9-12 (in the filter's color), for adjusting its boost/cut and/or frequency:

For the EQ filters, when you click the handle, you’ll also see lines on either side for adjusting the Q parameter, as shown above.

Shortcut: hold down the Option/Alt key while clicking an EQ filter handle to enable or bypass that EQ filter band.

**EQ filters**
The EQ filters have three parameters:

<table>
<thead>
<tr>
<th>Control</th>
<th>unit</th>
<th>range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gain</td>
<td>dB</td>
<td>-20.00 to +20.00</td>
</tr>
<tr>
<td>Frequency</td>
<td>Hertz</td>
<td>20 Hz to 20 kHz</td>
</tr>
<tr>
<td>Q</td>
<td>n/a - see note below</td>
<td>0.01 to 3.00</td>
</tr>
</tbody>
</table>

**Q**
The Q setting does not have a unit of measurement. Rather, it is the ratio of the filter’s center frequency to the bandwidth of the filter. In addition, the actual Q value for the EQ curve being applied is dependent on three factors: the gain setting, the filter style, and the Q setting.

**Filter types**
Each filter can be independently set to one of four different filter types: I, II, III and IV. These, and the additional shelf filters for the LMF and HMF band, are discussed in the section “EQ filter styles”.

**Returning to zero (or nominal frequency)**
To return a knob to zero, or it’s nominal frequency, double-click it.

**EQ filter styles**
EQ is one of the most widely used processing tools and can be applied to many different situations, from minor corrective tasks to highly creative applications. Over the years, many EQs have been engineered for specific applications or to achieve a certain sound. The Vintage EQ has been designed to be flexible enough to cover a broad range of applications. To that end, several different filter types are supplied, varying mostly in the way they handle the dynamic interaction between Gain and Q. This crucial relationship has been modeled to emulate the smooth and musical character of classic analog EQ circuits, in which the Gain/Q dependency was dictated by the actual circuit design and electrical components used. The following sections describe the character of each type of EQ filter and their suggested applications. In the three example illustrations (Figure 9-13 through Figure 9-16), the settings for the curves are the same for comparison purposes:

- Frequency = 1.00 kHz
- Q = 1
- Gain = +3, +10 and +20 dB
The **Type I** EQ filter has the least amount of Gain/Q interaction, providing the most precision and control of all the EQ filter types. Even small adjustments in gain or reduction produce relatively high Q. This EQ style is best for situations that call for precise EQ adjustments requiring the maximum amount of individual parameter control. For more general shaping (e.g. full mixes) or subtle control (e.g. vocals), the other styles discussed in the following sections might be more appropriate. This filter type is the most similar to a standard parametric EQ.

The **Type II** EQ filter produces constant Q response during boost or cut. The Type II style emulates several classic legacy EQs and produces good results for resonance control on drums and percussion because it provides relatively high Q values with more extreme gain or cut settings.
The **Type III** EQ filter increases Q as boost is applied. Therefore, lower amounts of boost provide a softer, “wider” EQ effect (since the affected frequency range widens), while higher boost tends to sound louder and more “up front”, due to the increase in Q as the gain is increased. The more gentle Q curve at lower settings is well suited for overall EQ fills and more subtle corrections in instrument and vocal sources. Boosting or cutting by small amounts will seem to produce the effect that your ear expects, without the need to adjust Q. As a result, this filter style, and similar EQs with this characteristic behavior, are often referred to as being more “musical”. More specifically, this style emulates the classic Neve EQs, their modern derivatives and later SSL G series EQs. Many current popular outboard “boutique” EQs exhibit this same gain/Q relationship.

The **Type IV** EQ filter is a more extreme form of the Type III filter. It exhibits a high degree of interaction between Q and gain in order to maintain as closely as possible an equal amount of area under the response curve as gain is adjusted. Type IV is the most gentle of the four EQ styles and is ideal for large scale EQ adjustments, especially on sub-mixes and complete mixes. This EQ style is also ideal for any applications where subtle changes in the overall character of the sound are desired. For example, it can be used for mastering applications, such as the overall adjustments that must often be applied to entire tracks to match other tracks on the album.
Shelf filters

When two top-most bands in the EQ tab are set to their shelf filter setting (Figure 9-10), the Q parameter controls the amount of overshoot applied to the response curve, as illustrated in Figure 9-17. When Q = 0.01 (the lowest setting), normal shelving is applied with no overshoot. This produces the response provided by a first order shelf. When Q = 1.0 (the default setting), the response corresponds to a second order shelf, still with no overshoot. This is the same response as conventional parametric EQs. In some situations, this form of accurate, clean shelving can sound harsh, especially when compared to legacy analog EQs. To soften the results, the overshoot is increased as Q is increased, as shown Figure 9-17 for Q values of 1.00, 2.00 and 3.00. This overshoot region produces a boost in frequencies just above the cutoff, which compensates in a smooth, more pleasing fashion for the perceived drop in low frequencies being cut.

Conversely, when shelving boost is being applied, overshoot cuts frequencies just above the cutoff to again compensate in a smooth and pleasing fashion for the perceived boost in low frequencies:

Overshoot is also applied to high shelf boost and cut:
Overshoot tends to produce more of what one would expect to hear when applying shelving and is therefore considered to be more musical than shelving without overshoot. This effect, which has gained tremendous popularity among audio engineers, was first made popular in original Neve series EQs and later in the SSL G series.

At maximum the maximum Q setting of 3.00, the overshoot peaks at half the total boosted (or cut) gain. For example, with a maximum gain setting of +20dB, the loss in the overshoot region is -10 dB.

Overshoot curves are symmetrical for both cut and boost.

**Low pass and high pass filters**

The Vintage EQ low and high pass filters are similar to those found in most conventional parametric EQs (which usually have a fixed slope of 12 dB per octave), except that Vintage EQ provides six different slope (roll off) settings: 6, 12, 18, 24, 30 and 36 dB per octave. This control over the shape of the "knee" gives you a great deal flexibility and control for a wide variety of applications.

The Dynamics tab
The Dynamics tab (Figure 9-21) displays the Dynamics processing settings for the input or output channel that currently has the focus. Click any focus button in the Inputs or Outputs tab to view the Dynamics tab settings for the channel.

Figure 9-21: The Dynamics tab.

Enabling Dynamics
Each input and output channel has a global Dynamics enable/disable button (Figure 9-3 and Figure 9-6). This button enables or disables all dynamics processing for the channel. In addition, the Dynamics tab has two different dynamics processors, the Compressor and Leveler, which can be individually enabled or disabled (Figure 9-21) for the channel.

Compressor
The Compressor (Figure 9-21) lowers the level of the input when it is above the threshold. The amount of attenuation is determined by the Ratio and the input level. If the input is 6 dB above the Threshold and the Ratio is 3:1, then the output will be 2 dB above the Threshold. When the input level goes above the threshold, the attenuation is added gradually to reduce distortion. The rate at which the attenuation is added is determined by the Attack parameter. Likewise, when the input level falls below the Threshold, the attenuation is removed gradually. The rate at which the attenuation is removed is determined by the Release parameter. Long Release times may cause the audio to drop out briefly when a soft passage follows a loud passage. Short Release times may cause the attenuation to pump when the average input level quickly fluctuates above and below the Threshold.

These sorts of issues can be addressed by applying the Leveler instead.

Graphic adjustment of the Threshold
The Threshold can be adjusted by turning the Threshold knob or by dragging the Threshold line directly in the compressor graph (Figure 9-21).

Input level meter
The Input Level meter (Figure 9-21) shows the level of the input signal before it enters the compressor. It shows either the peak level or the RMS level, depending on which mode is currently chosen.

Gain reduction (GR) meter
The Gain reduction (GR) level meter (Figure 9-21) displays the current amount of attenuation applied by the compressor.

Output level
The Output Level meter (Figure 9-21) displays the peaks of the output signal. Trim is applied before the Output Level meter.
Peak/RMS modes
In RMS mode the compressor uses RMS values (a computational method for determining overall loudness) to measure the input level. In Peak mode, the compressor uses signal peaks to determine the input level. RMS mode will let peaks through because the detector sidechain is only looking at the average signal level. Peak mode will react to brief peaks. Peak mode is generally used for drums, percussion and other source material with strong transients, while RMS mode is mostly used for everything else.

The input meters show either the peak level or the RMS level, depending on the mode.

Leveler
The Leveler™ (Figure 9-21) provides an accurate model of the legendary Teletronix™ LA-2A® optical compressor, known for its unique and highly sought-after Automatic Gain Control (AGC) characteristics. The 896mk3 Leveler faithfully models the LA-2A using the on-board DSP with 32-bit floating point precision.

A model of an optical compressor
The simplest description of an optical leveling amplifier device is a light shining on a photoresistor. The intensity of the light source is proportional to the audio signal, and the resistance of the photoresistor is in turn inversely proportional to the intensity of the light. Photoresistors respond quite quickly to increases in light intensity, yet return to their dark resistance very slowly. Thus, incorporation of the photoresistor into an attenuator followed by an amplifier which provides make-up gain produces a signal which maintains a constant overall loudness.

Automatic gain control using light
The Automatic Gain Control (AGC) circuit of the LA-2A uses a vintage opto-coupler known by its model number (T4). The T4 contains an electroluminescent panel (ELP) and photoresistor mounted so that the emission of the panel modulates the resistance. An ELP consists of a thin layer of phosphorescent material sandwiched between two insulated electrodes to form a capacitor. Making one of the electrodes transparent allows the light to escape. These devices are essentially glow-in-the-dark paint on a piece of foil covered by metalized glass or plastic, and are the same devices used in low-power night lights. Unfortunately, these devices need high voltages to operate, and are best driven by tube circuits which can supply voltage swings of several hundred volts.

Response characteristics
Once the light has faded away, the photoresistor then decays back to its dark state. The shape of the decay curve varies depending on how bright the light was, and how long the light lasted. A general rule of thumb is that the louder the program, the slower the release. Typically, the release can take up to and over one minute. One thing to keep in mind when using these types of devices is that the typical concepts of compression ratio, attack, release, and threshold do not apply. The light intensity is determined by the highly non-linear interactions of the input signal, AGC circuit, and ELP, and thus exhibit a strong program dependence that is impossible to describe without the mind-numbing mathematics of statistical mechanics. The actual results, however, can be almost mystical: even when you feed the same material (a loop perhaps) through the Leveler twice, you'll often see a new response the second time through a loop, complete with unique attack times, release times and compression ratios. Furthermore, two different input signals with the same RMS levels may be leveled in a drastically different manner.
It is precisely this self-adjusting behavior that makes optical compressors the tool of choice for smoothing out vocals, bass guitar and full-program mixes without destroying perceived dynamics.

**Compressor/Limit buttons**
The *Comp* and *Limit* buttons (Figure 9-21) model the original LA-2A Limit/Compress mode switch. The effect is very subtle, with the Limit option behaving only slightly more like a limiter than a compressor. The switch increases the level of the input to the AGC model and runs the attenuator at a slightly lower level. The Leveler then responds more strongly to transients, but otherwise still behaves like a leveling amplifier.

**Gain Reduction**
*Gain Reduction* (Figure 9-21) sets the strength of the signal sent to the AGC model.

**Makeup Gain**
*Makeup gain* (Figure 9-21) amplifies the output signal to make up for gain reduction.

**Enabling or disabling the Leveler**
The Leveler models the LA-2A so closely, it also models the time it takes for an actual LA-2A to “warm up” after it is turned on. Therefore, when you enable the Leveler, give it a moment to “settle” before you begin processing signals with it.

**The Meters tab**
The *Meters* tab (Figure 9-22) serves as a comprehensive meter bridge for all inputs, outputs and mix busses in the 896mk3. This tab gives you a “bird’s-eye” view of all signal activity in the 896mk3; it is ideal for confirming your signal routing programming and for troubleshooting.

**Channel meter display**
The *channel meter display* (Figure 9-22) provides a long-throw meter for the input or output that currently has the focus in the Input/Output tabs.

**Bus activity LEDs (inputs only)**
The *Bus activity LEDs* (Figure 9-22) are present only for inputs. See “Input meter and bus activity LEDs” on page 84.

**Pre/post processing switch**
The *pre/post processing switch* (Figure 9-22) affects all input meters (and the meter in the channel meter display above the tab, if this area is
displaying an input meter). Click Pre to view levels before any input channel processing besides trim; click Post to view levels after all channel processing (EQ, compression, M/S decoding, L/R swap, etc.)

The Reverb tab
The Reverb tab (Figure 9-23) provides access to the 896mk3’s single, global reverb processor, which provides high-fidelity reverberation and graphic control over its parameters.

Routing inputs, busses and outputs to the reverb processor
The reverb processor is a single, independent unit that provides stereo reverb. You can route multiple signals to it from various points (sends) in the CueMix FX mixer, but all incoming signals to the reverb processor are merged and processed together. The resulting stereo output from the reverb can then be inserted into a mix bus or output using stereo returns.

Reverb sends
The following signals can be sent to the reverb processor via their corresponding sends (discussed earlier in this chapter):

■ Mono or stereo inputs (Figure 9-3 on page 79)
■ Mix bus output (Figure 9-2 on page 77)
■ Outputs (Figure 9-6 on page 82)

Reverb returns
The stereo output from the reverb processor can be sent to the following destinations via their corresponding returns (discussed earlier in this chapter):

■ Mix bus outputs
■ Outputs
■ The computer (via the Reverb Return bus)

Split point
The Split Point (Figure 9-23) prevents feedback loops that would be caused by a signal being sent to the reverb processor and then returned to the same signal path.

Mix
When the Split Point is set to Mix, the returns in the Mix bus tab become active and the sends in the Output tab gray out. This allows you to send from inputs and mixes and return to mixes and outputs.

Enabling reverb
Use the enable/disable button (Figure 9-23) to turn the reverb processor on or off. Since reverb uses considerable DSP resources, it is best to leave it off when you are not using it.
Output
When the Split Point is set to Output, the sends in Output tab become active and the returns in the Mix bus tab gray out. This allows you to send from inputs, mixes and outputs and return to outputs.

Primary controls
The Primary Controls section (Figure 9-23) in the Reverb tab provides the following basic parameters for programming the reverb.

Reverb Time
Reverb time determines the length of decay, or tail, of the reverb. This is a global setting for the reverb processor. You can further refine the tails by independently setting the reverb time of three separate frequency bands, as discussed below in the Reverb Design section.

PreDelay
PreDelay is the amount of time before you hear the very first reflections. If you are in a large room, it takes a while before the first reflections return. PreDelay is useful for clarifying the original sound. For example, with vocals, the reflections won’t start until after the initial sound of a word has been sung.

Shelf Filter
The Shelf Filter is a low-pass filter that controls the high frequency characteristics of the overall effect. Frequency sets the cutoff frequency for the filter and Cut sets the amount of signal attenuation applied by the filter.

Early reflections
Initial reflections give a space its unique sound. The shape of the room, the angles of the walls, even furniture in the room will produce a series of Initial Reflections. Think of the early reflections and room type as the “flavor” of the reverb. You can choose between several types of rooms. These are acoustic models for simulating these different types of spaces. The Size and Level parameters let you control the size of the room and the strength of the initial reflections.

Reverb design
The Reverb Design section allows you to independently control the reverb time for three separate frequency bands (Low, Mid and High) with adjustable cross-over points between them (Low and High). The reverb time for each band is specified in percent of the overall reverb time in the Primary Controls section at the top of the tab.

You can edit these parameters graphically by dragging the handles in the graphic display (Figure 9-23).

Width does what its name implies: if you turn this control all the way up, the result is maximum stereo imaging. A position of 12 o’clock produces essentially a mono image. Turning the control all the way down completely swaps the stereo image.

THE MONITOR GROUP
The monitor group is a set of 896mk3 outputs that can be controlled with the master Monitor Level knob in upper right corner of the CueMix FX mixer window (Figure 9-24), as well as the MASTER VOL knob on the 896mk3 front panel.
Assigning outputs to the monitor group
Any combination of outputs can be assigned to the monitor group. To include an output pair in the monitor group, click its Monitor button in the Outputs tab (Figure 9-6 on page 82).

Monitor group preset menu
The monitor group preset menu (Figure 9-24) provides several presets for commonly used monitor groups:

<table>
<thead>
<tr>
<th>Monitor group preset</th>
<th>Output assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Outs</td>
<td>Main Out 1-2</td>
</tr>
<tr>
<td>Stereo</td>
<td>Analog Out 1-2</td>
</tr>
<tr>
<td>Quad</td>
<td>Analog Out 1-4</td>
</tr>
<tr>
<td>5.1</td>
<td>Analog Out 1-6</td>
</tr>
<tr>
<td>7.1</td>
<td>Analog Out 1-8</td>
</tr>
</tbody>
</table>

If you program your own monitor output group, the presets menu displays the word *Custom*.

Monitor group meters
The monitor group meters (Figure 9-1 on page 75) show levels for any/all output pairs that are currently included in the monitor group. The width of the meters scales proportionally so that all current monitor group outputs will fit within the prescribed space for the meters. If many outputs are included, then the meters will look fairly thin, but they will all be included in the meter.

DSP METER
The DSP meter (Figure 9-1) shows how much of the available DSP processing power is currently being used by the 896mk3 for effects processing. DSP resources are allocated in channel order from the first input to the last output. If there aren’t enough DSP resources for all effects to be enabled on a channel, none of them are allocated on that channel or any following channel.

EQ on a stereo channel requires approximately twice the DSP resources as the same EQ on a mono channel. The Compressor (2.5 x 1 EQ band) and Leveler (4 x 1 EQ band) require about the same DSP resources for a mono or stereo channel.

SOLO LIGHT
The Solo light (Figure 9-1) illuminates when any input in the current (active) mix bus is soloed (even if it is currently scrolled off-screen).

TALKBACK AND LISTENBACK
CueMix FX provides *Talkback* and *Listenback* buttons. Talkback allows an engineer in the control room to temporarily dim all audio and talk to musicians in the live room. Conversely, Listenback allows musicians to talk to the control room.

Hardware setup
Figure 9-25 below shows a typical hardware setup for Talkback and Listenback. For Talkback, set up a dedicated mic in your control room and connect it to a mic input on your MOTU audio interface. For Listenback, set up a dedicated listenback mic in the live room for the musicians and connect it to another mic input (or just use one of the mics you are recording from). For talkback output, set up a headphone distribution amp or set of speakers in the live room, and connect it to any 896mk3 output, as demonstrated below in Figure 9-25.
To configure the talkback mic in CueMix FX, go to the Inputs tab (Figure 9-3 on page 79) and click the Focus button for the input that the talkback mic is connected to. Click the Channel tab (Figure 9-8 on page 83) and enable the Talk button. Repeat this procedure for the Listenback mic, except click the Listen button in the Channel tab.

Talkback / Listenback Mic Input
To configure the talkback mic in CueMix FX, go to the Inputs tab (Figure 9-3 on page 79) and click the Focus button for the input that the talkback mic is connected to. Click the Channel tab (Figure 9-8 on page 83) and enable the Talk button. Repeat this procedure for the Listenback mic, except click the Listen button in the Channel tab.

Engaging/disengaging Talkback and Listenback
To engage Talk back or Listenback, press on the Talk or Listen buttons (Figure 9-26) and then release to disengage. Talkback and/or Listenback is engaged for as long as you hold down the mouse button. Option-click to make the buttons “sticky” (stay engaged until you click them again — so you don’t have to hold down the mouse). Or use the Talkback menu items.

If you would like to engage both Talkback and Listenback at the same time, enable the Link button (Figure 9-26).

Controlling Talkback and Listenback volume
To control the volume of the Talkback and/or Listenback mics, adjust their input trim in CueMix FX.

Talkback / Listenback Monitor Dim
Use the knobs next to the Talk and Listen buttons (Figure 9-26) to determine the amount of attenuation you would like to apply to all other audio signals (besides the talkback/listenback signal) when Talkback and/or Listenback is engaged. To completely silence all other CueMix audio, turn them all the way down. Attenuation only occurs when talkback or listenback is engaged. Audio playing back from disk (your host software) is not affected.

FILE MENU

Saving and loading hardware presets
The 896mk3 can store up to 16 presets in its onboard memory. A preset includes all CueMix FX settings for all mix busses, but it excludes global settings like clock source and sample rate.

The Load Hardware Preset and Save Hardware Preset commands in the CueMix FX file menu let you name, save and load presets in the 896mk3.

Peak/hold time
In CueMix FX, a peak indicator is a line (representing a virtual LED) displayed in a level meter that indicates the maximum signal level registered by the meter. The Peak/hold time setting (File menu) determines how long this indicator remains visible before it disappears (or begins to drop). To disable peak/hold indicators altogether, choose Off from this sub-menu.

Mix1 Return Includes Computer
The Mix1 return includes computer File menu item applies to other MOTU interfaces products and has no effect on the 896mk3.

Hardware follows CueMix Stereo Settings
This File menu item applies to other MOTU interfaces products and has no effect on the 896mk3.

Show meter in dock icon
This CueMix FX File menu item applies to other MOTU interfaces and has no effect on the 896mk3.
EDIT MENU

Undo/Redo
CueMix FX supports multiple undo/redo. This allows you to step backwards and forwards through your actions in the software.

Copying & pasting (duplicating) entire mixes
To copy and paste the settings from one mix to another:

1. Select the source mix (Figure 9-1) and choose Copy from the Edit menu (or press Command-C).
2. Choose the destination mix and choose Paste from the Edit menu (or press Command-V).

Clear Peaks
Choose Clear Peaks from the Edit menu to clear all peak indicators in all CueMix FX meters.

DEVICES MENU
If you are working with more than one MOTU audio interface product, this menu displays all interfaces that are currently online. Choose any device from the menu to edit its settings using the CueMix FX software.

Audio analysis tools
Below each device are its signal analysis tools. Choose one to open its window. For details on these features, see the following sections.

Choosing channels for audio analysis
The audio analysis tools follow the currently focused audio input or output. (See “Channel focus and settings” on page 76.) If you focus a mono channel (e.g. Analog 3), its corresponding stereo pair will be displayed (Analog 3–4).

Scoping host software audio output
If you want to scope audio output from your host software, send your host’s output to an 896mk3 output pair, and then set the focus on that output pair.

FFT AND SPECTROGRAM DISPLAY
FFT and spectrogram information can be displayed in the Filter response display section in the EQ tab (Figure 9-10 on page 85) or as a separate window (Figure 9-29 on page 101) opened from the Devices menu (Figure 9-27).

Filter display options
The Filter display options menu (Figure 9-28) provides several options for the EQ filter display:

<table>
<thead>
<tr>
<th>Menu option</th>
<th>What it does</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show no analysis</td>
<td>Turns off both the FFT and Spectrogram in the Filter display.</td>
</tr>
<tr>
<td>Show FFT</td>
<td>Shows/hides a real time FFT analysis of the current signal being EQ’d, post EQ filter.</td>
</tr>
<tr>
<td>Show Spectrogram</td>
<td>Shows/hides a real-time spectrogram “waterfall” in the background of the filter display, post EQ filter.</td>
</tr>
<tr>
<td>Show Band Response</td>
<td>Shows/hides the colored area below EQ filter points.</td>
</tr>
<tr>

Figure 9-28: Filter Display options menu
**FFT display**

Choose Show FFT from the Filter display options menu (Figure 9-10) to superimpose a real-time Fast Fourier Transform (FFT) frequency measurement curve over the EQ filter display, as demonstrated in Figure 9-30:

The FFT curve is post-filter. Therefore, the FFT shows the results of the EQ filter(s) being applied. Use the global EQ button for the input or output channel (Figure 9-3 and Figure 9-6, respectively) to toggle between the EQ'd and non-EQ'd FFT display for an A/B comparison.

**Spectrogram**

Choose Show Spectrogram from the Filter display options menu (Figure 9-10) to superimpose a real-time spectrogram “waterfall” display in the background of the EQ filter display, as demonstrated in Figure 9-31:

The spectrogram scrolls from top to bottom, where the top edge of the display represents what you are hearing “now”. Color represents amplitude along the left/right frequency spectrum. The amplitude color scale runs from black (silence) to red (full scale) as follows:

**Opening the FFT Analysis window**

Choose FFT Analysis from the Devices menu to open a new window with the filter EQ display for detailed inspection and adjustment of the EQ filter, as shown Figure 9-29.
You can show and hide the FFT display, spectrogram or EQ band response curves as desired using the Display Options menu options (Figure 9-29). These settings are independent of the small graph display options (Figure 9-10), so you have the flexibility to display different combinations in each graph.

“Show EQ Controls” will be available only if the focused pair are a stereo input pair or stereo output pair.

Logarithmic or Linear X-Axis Scale
The x-axis defaults to a logarithmic scale, but can be changed to a linear scale if desired. In the View controls (Figure 9-33), click Logarithmic to access the x-axis scale options menu. With a linear scale selected, frequency is constant, but the width of each octave along the x-axis is different. With a logarithmic scale selected, octaves are displayed with a constant width, but frequency is displayed logarithmically within each octave.

Axes display
The Axes control (Figure 9-33) sets the opacity of the grid displayed in the graph, from 100% (fully visible) down to 0% (fully hidden).

Pausing the display
The Pause button in the upper right corner of the View section (Figure 9-33) allows you to freeze the display at any time. To resume, click the button again.

The info box
When any EQ filter point is selected or dragged in the full window graph, the info box is shown next to the point in the full graph display (Figure 9-34).

The info box includes the industry standard scientific note (pitch) name when the control point is located at a frequency that resides within a prescribed note range, where C4 is middle C. The note number is accompanied by the number of cents (±50) above or below the exact frequency for the note. If the control point is dragged outside the note range, only the frequency is shown.

Horizontal controls (frequency axis)
The Horizontal controls (Figure 9-35) configure the value range of the x-axis (frequency). Click and drag the values up or down to set them, or double-click to return to the default value.

There are two modes for the controls: Zoom/Offset and Min/Max. To change the mode, use the Horizontal control menu (Figure 9-35).

In Zoom/Offset mode, Zoom sets the display zoom from 1x to 100x, where the number represents the zoom factor relative to the entire frequency range. For example, when the horizontal zoom value is 1x, the entire frequency range from 10 to 24000 Hertz is displayed; when the horizontal zoom value is 2x,
one half of the entire frequency range is displayed. 

Pos determines which frequency is displayed at the center of the graph.

In Min/Max mode, Min and Max set the lowest and highest displayed frequencies (in Hertz).

**Vertical controls (amplitude axis)**
The Vertical controls (Figure 9-29) operate similarly to the Horizontal controls, except that they configure the y-axis (amplitude). In Zoom/Offset mode, Zoom sets the display zoom from 1x to 100x, and Pos sets the center amplitude of the graph. In Min/Max mode, Min and Max set the smallest and largest displayed amplitude.

**Spectrogram controls**
The Floor control (Figure 9-29) sets the amplitude threshold for the spectrogram display, from -144 dB up to 0 dB.

The Alpha control (Figure 9-29) sets the opacity of the spectrogram information displayed in the graph, from 100% (fully visible) to 0% (hidden).

**OSCILLOSCOPE**
The Oscilloscope (Figure 9-36) graphs the amplitude of an audio signal over time. Amplitude is displayed on the y-axis and time is displayed on the x-axis. A thick white vertical line marks where time equals zero; a thick white horizontal line marks where amplitude equals zero (Figure 9-36, below).

Level meters are displayed to the right of the graph. One or two meters are shown, depending on the current view mode (see “View controls”).

**Opening the oscilloscope**
Each 896mk3 has its own oscilloscope. To open an oscilloscope, choose the Oscilloscope item from the Devices menu under the desired interface.

**Choosing a channel to display**
The oscilloscope follows the currently focused audio input or output. If you focus a mono channel (e.g. Analog 3), its corresponding stereo pair will be displayed (Analog 3–4).

**View controls**
The View controls (Figure 9-37) provide several options for the oscilloscope display.

The View menu (Figure 9-37) lets you choose how you wish to display the audio channel(s) being displayed.

Display options
The Axes control (Figure 9-37) sets the opacity of the grid displayed in the graph, from 100% (fully visible) down to 0% (fully hidden). The Show Ruler option toggles the measurement items (see “Measurement information” on page 106).

Pausing the display
The Pause button in the upper right corner of the View section (Figure 9-37) allows you to freeze the display at any time. To resume, click the button again. The level meters will remain active while the display is paused.

Horizontal controls (time axis)
The Horizontal controls (Figure 9-38) configure the value range of the x-axis (time). Click and drag the values up or down to set them, or double-click to return to the default value.

There are two modes for the controls: Zoom/Offset and Min/Max. To change the mode, use the Horizontal control menu (Figure 9-38).

In Zoom/Offset mode, Zoom sets the display zoom from 1/1000x to 10x, where the number represents the number of pixels per sample. For example, when the horizontal zoom value is 10x, 10 samples are displayed in 100 pixels; when the horizontal zoom value is 1/10x, 100 samples are displayed in 10 pixels. Offset moves the line marking time equals zero left or right.

In Min/Max mode, Min and Max set the earliest and most recent displayed time.

Time Units
The Time Units sub-menu (Figure 9-38) provides the option to view the X axis in Seconds or Samples.

Vertical controls (amplitude axis)
The Vertical controls (Figure 9-38) operate similarly to the Horizontal controls, except that they configure the y-axis (amplitude).

In Zoom/Offset mode, Zoom sets the display zoom from 1/2 to 100x, and Offset moves the line marking amplitude equals zero line up or down.

In Min/Max mode, Min and Max set the smallest and largest displayed amplitude.

Waveform Recognition
The Waveform Recognition option searches through new audio data looking for a waveform which most resembles that which was previously displayed. The region where this takes place is a small window around the line marking time equals
zero, denoted by the extra vertical graph lines surrounding it. There are two kinds of waveform recognition available: Type I and Type II.

Type I recognition provides the most stable display of the waveform. It is the most resistant to change. Louder transients, such as those produced by a snare drum, are not displayed inside of the waveform window. Type I is best for observing the shape of a signal produced by a synthesizer or observing the tone of a guitar through a chain of pedals.

Type II recognition is less resistant to change. It will include loud transients within the waveform recognition window. Type II is better for observing percussive music where the beat itself is to be centered within the waveform window.

Criteria
The criteria checkboxes (Figure 9-40) determine the conditions that the trigger is looking for and where it will look for them.

The Left checkbox causes the condition to be looked for in the left channel of the signal; likewise, the Right checkbox looks for the condition in the right channel. One or both of these can be enabled simultaneously. If neither is enabled, the criteria will not be found because the trigger is not looking at any audio signal.

The Pos and Neg checkboxes determine the slope of the event. When the Pos checkbox is enabled, the trigger will look for an event where amplitude is increasing; likewise, enabling the Neg checkbox tells the trigger to look for an event where amplitude is decreasing. One or both of these can be enabled simultaneously. If neither is enabled, the criteria will not be found because the trigger is not looking for any particular kind of event.

The Level setting defines the amplitude threshold that the trigger is looking for. The Level is indicated on the graph by a blue horizontal line (or two blue horizontal lines, if Magnitude is enabled). Events which cross this threshold using the enabled slope(s) in the enabled channel(s) will activate the trigger. The response of the trigger is set by the Trigger mode (see “Trigger modes”, below).

Enabling the Magnitude checkbox tells the trigger to look for both positive and negative Level values, regardless of whether the Level value is positive or negative. For example, if Level is set to +0.500 and Magnitude is enabled, the trigger will look for both +0.500 and -0.500. You will see a second blue line appear in the display when Magnitude is enabled to denote the second value.
Holdoff

*Holdoff* defines a time interval during which the oscilloscope does not trigger. The most recent trace will be displayed during that period. When the period is over, the trigger is “re-armed”, i.e. it will begin looking for the criteria again.

Click and drag this value up or down to set it, or double-click to return to the default value.

Trigger modes

The Trigger menu (Figure 9-40 on page 105) provides four modes:

<table>
<thead>
<tr>
<th>Trigger mode</th>
<th>What it does</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>The Trigger is not active; this is the default mode. The incoming audio signal will be displayed continuously as audio is received.</td>
</tr>
<tr>
<td>Auto</td>
<td>The display is always updating, but when the condition is met, the trigger event will be displayed centered around the line marking time equals zero.</td>
</tr>
<tr>
<td>Normal</td>
<td>The display updates only when the condition is met; the last trace will be displayed until the next matching event is found.</td>
</tr>
<tr>
<td>Single Sweep</td>
<td>Similar to Normal mode, but the last trace will be displayed until you manually arm the trigger by clicking the Trigger indicator (Figure 9-40 on page 105) or by pressing the spacebar.</td>
</tr>
</tbody>
</table>

Trigger indicator

The Trigger indicator (Figure 9-40 on page 105) displays the state of the trigger, and also provides a way to manually interact with it. The Trigger indicator always displays one of three colors:

<table>
<thead>
<tr>
<th>Color</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>When the current Trigger criteria has been met (including when the Trigger mode is None).</td>
</tr>
<tr>
<td>Yellow</td>
<td>When the Trigger is armed, but has not yet found an event which matches its criteria. Yellow can also indicate that the graph has been manually paused using the Pause button in the View section (see “Pausing the display” on page 104).</td>
</tr>
<tr>
<td>Red</td>
<td>When the Trigger is being held off, either because the Trigger mode is set to Single Sweep or the Holdoff time is not set to zero.</td>
</tr>
</tbody>
</table>

You can also click on the Trigger indicator to force certain actions, depending on the Trigger mode. In Auto and Normal modes, clicking on the Trigger indicator causes the display to run freely; you may click & hold to force this to occur for as long as you’d like. In Single Sweep mode, clicking on the Trigger indicator re-arms the trigger. When the Trigger mode is None, clicking on the Trigger indicator has no effect.

Measurement information

You can view detailed information about a particular time range by using the measurement bars.

![Figure 9-41: Measurement information](image-url)
To adjust the left and right edges of the measurement area, click and drag the blue bars in the graph, or click and drag the blue numbers in the upper left or right corners. To reset them to the default value, double-click the numbers.

Information about the measured area is displayed at the center of the top ruler: the duration (in seconds and samples), the approximate frequency, and the scientific note name. If the measured area is long enough, the approximate beats per minute (bpm) is displayed.

**Ideas for using the Oscilloscope**
The Oscilloscope can be used in many useful ways during the routine operation of your recording studio. Here are just a few examples.

**Analyzing and comparing harmonic content**
The oscilloscope lets you “see” the nature of the harmonic profile in any audio material. You can also view two signals side by side (in stereo mode) to compare their profiles and, if necessary, make adjustments to the source of each signal and view your changes in real time.

**Viewing transients such as drum hits**
If you loop a snare hit or other similar transient audio clip and feed it through the oscilloscope, you can more or less “freeze” the transient waveform in the oscilloscope frame. This can be useful, for example, for viewing the results of real-time compression that you are applying with an effects plug-in, as demonstrated in Figure 9-42. In this example, a snare hit is being compressed by Digital Performer’s Dynamics plug-in. As you make adjustments to the compression plug-in’s settings, you can see the transient waveform change the next time the Oscilloscope triggers. For compression, this can be particularly useful for balancing the effect of the attack on the transient, relative to the decay portion of the waveform. Conversely, you can see the effect of the threshold setting directly on the decay portion, relative to the attack. In effect, you can see as well as hear the results of your compression adjustments.

To view a transient waveform in the Oscilloscope display, turn off Waveform Recognition and use the Normal Trigger mode. Adjust the level high enough to encompass the vertical amplitude of most of the transient. If the transient pulse sweeps across the screen, try raising the Holdoff level. Once the...
transient is settled in the display and fairly stable, you may need to adjust the horizontal position to center it in the display. These settings are depicted in the example in Figure 9-42.

You can also pause the display at any time and adjust the horizontal bounds to locate a transient.

Clip detection
You can use the Oscilloscope to detect clipping in a digital audio signal. To do so, enable all criteria (Figure 9-40 on page 105), choose Single Sweep from the trigger menu (Figure 9-40), set the level to 0.999 and click the trigger indicator (Figure 9-40) to arm it (yellow). As soon as the signal clips, the trigger indicator will turn red, and the display will show the offending clip at the line marking time equals zero.

Viewing timing pulses
If you have two audio signals with recognizable, timed pulses in them, and you wish to compare their timing with respect to each other, you can use Split Screen or Shared view to visually compare the timing of the two signals. You can zoom in to the sample level for sample accurate viewing.

Building synthesizer patches
If you are building a synth patch on a synthesizer (or forming similar highly periodic audio material), you can run the audio signal through the Oscilloscope as you adjust its sound to check in real time for undesirable (and possibly inaudible) characteristics, which are easily seen in the Oscilloscope display. A good example is DC offset. If a signal develops DC offset, the apparent vertical center of its overall waveform will drift above or below the line marking amplitude equals zero. Try setting Waveform Recognition to Type I and setting Trigger to None.

Another example is waveform polarity. If you are combining several raw waveforms, polarity is a critical, yet not always obvious, factor in determining the resulting sound. You can use the Oscilloscope to easily view and compare polarities to see if they are inverted from one another or not. The Add and Subtract L - R View menu settings are particularly useful here.

You can also use the Oscilloscope to help you apply waveform modulation and keep it “in bounds”. For example, you could easily see if pulse width modulation is collapsing in on itself to choke the sound, an effect that is readily seen in the Oscilloscope display but not necessarily easy to determine by ear when using multiple modulation sources.

Guitarists can also visually observe the effects of their pedals and processing, while playing. With the Trigger mode set to None and Waveform Recognition set to Type I, the waveform will be tracks automatically.

When applying filters and filter resonance, the visual effect on the waveform can be invaluable in reinforcing what you are hearing as you make adjustments.

Monitoring control voltage output from Volta
MOTU’s Volta instrument plug-in for Mac OS X turns your audio interface into a control voltage interface, giving you precise digital control from your favorite audio workstation software of any hardware device with a control voltage (CV) input. The CV signals output from Volta can be monitored in the Oscilloscope, giving you visual feedback on LFOs, envelopes, ramps, step sequencers, and more.

For more information on Volta, see www.motu.com.
X-Y PLOT
The X-Y Plot window (Figure 9-43) graphs the amplitude of a stereo audio signal on a two-dimensional grid.

For each unit of time (i.e., each sample), the amplitude of the left channel is displayed on the x-axis and the amplitude of the right channel is displayed on the y-axis. A thick white vertical line marks where left channel amplitude equals zero; a thick white horizontal line marks where right channel amplitude equals zero (Figure 9-43, below). There are also thick white diagonal lines for \( y = x \) and \( y = -x \).

Metering
Level meters are displayed above and to the right of the graph for the left (green) and right (red) channels, respectively. An additional Correlation meter (blue) is displayed on the right. This meter displays the correlation between the two channels. The higher the meter, the higher the correlation between the two channels. Below are a few examples:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Meter level</th>
<th>X-Y Plot graph</th>
<th>Mathematical relationship</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perfect correlation</td>
<td>+1</td>
<td>Diagonal line going from lower left to upper right:</td>
<td>( y = x )</td>
</tr>
<tr>
<td>Zero correlation</td>
<td>0</td>
<td>No discernible pattern</td>
<td>None</td>
</tr>
<tr>
<td>Perfectly out of phase</td>
<td>-1</td>
<td>Diagonal line going from upper left to lower right:</td>
<td>( y = -x )</td>
</tr>
</tbody>
</table>

Opening the X-Y Plot
Each 896mk3 interface has its own X-Y Plot window. Choose the X-Y Plot item from the Devices menu under the desired interface.

Choosing a channel pair to display
The X-Y Plot follows the currently focused audio input or output. If you focus a mono channel (e.g. Analog 3), its corresponding stereo pair will be displayed (Analog 3–4).
View controls
The View controls (Figure 9-44) provide several options for the X-Y Plot display.

Figure 9-44: View controls

Pausing the display
The Pause button in the upper right corner of the View section (Figure 9-44) allows you to freeze the display at any time. To resume, click the button again. The level meters will remain active while the display is paused.

Line/Scatter
Choose either Line or Scatter from the menu in the View section (Figure 9-44) to plot each point (sample) as either a single pixel or as a continuous line that connects each plot point to the next, as shown below in Figure 9-45.

Figure 9-45: The same X-Y Plot displayed in Line versus Scatter mode.

☛ Line mode is significantly more CPU intensive than Scatter. You can reduce Line mode CPU overhead on the X-Y Plot by reducing the Length parameter (described below).

Color/Grayscale
In Color mode (Figure 9-44) the most recently displayed audio data is shown in red, which fades to yellow, green and then finally blue, before disappearing. In Grayscale mode, data is first shown in white and then fades to gray. To adjust the scale of this color/brightness change, see “Decay” on page 111.

Axes
The Axes control (Figure 9-44) sets the opacity of the grid displayed in the graph, from 100% (fully visible) down to 0% (fully hidden).

Horizontal and vertical controls
The Horizontal and Vertical controls (Figure 9-46) configure the value range of the x-axis (left channel amplitude), and y-axis (right channel amplitude), respectively. Click and drag the values up or down to set them, or double-click to return to the default value.

There are two modes for the controls: Zoom/Offset and Min/Max. To change the mode, use the menu shown in Figure 9-46.

Figure 9-46: Setting the Horizontal or Vertical control modes.

In Zoom/Offset mode, Zoom scales the axis. Pos moves the lines marking x = 0 left and right, or y = 0 up and down.

In Min/Max mode, Min and Max let you scale the grid by moving the -1.0 and +1.0 points along the axis. Min/Max mode lets you control the graph boundaries directly.

Persistence
The Persistence controls (Figure 9-47) affect the appearance of data from when it is first displayed until it disappears from the grid.
Figure 9-47: The Persistence controls.

**Length**

*(Figure 9-47)* sets the number of recent samples to show on the plot. For example, when Length is set to 10,000, the 10,000 most recent samples are shown.

**Decay**

The brightness (in Grayscale mode) or hue (in Color mode) of each sample on the plot is determined by a linear scale, with the most recent sample displayed at the maximum value and the oldest sample displayed at the minimum value. *Decay* (Figure 9-47 on page 111) determines the brightness or hue of the minimum value. When Decay is zero, the oldest sample is black. When Decay is +1.000, the oldest sample is fully opaque (in Grayscale mode) or red (in Color mode).

**Warp**

*Warp* (Figure 9-47) determines the position of data points after they are first drawn. When warp is zero, data points remain in the same position. When warp is positive, they contract towards the origin (center of the grid). When warp is negative, they expand away from the origin. The further the warp value is from zero, the greater the effect.

---

**Using the X-Y Plot**

The X-Y Plot helps you “see” the width of the stereo field of a mix. It also helps you determine if a mix has issues with polarity, as follows:

<table>
<thead>
<tr>
<th>Activity on the X-Y Plot</th>
<th>What it indicates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signal activity occurs mostly along the x = y axis (lower left to upper right) and the Correlation meter reading is high</td>
<td>Left and right channels are predominantly in polarity (the stereo field is relatively narrow)</td>
</tr>
<tr>
<td>Signal activity occurs mostly along the y = -x axis (upper left to lower right) and the Correlation meter reading is low (near -1)</td>
<td>Left and right channels are predominantly out of polarity (not in phase)</td>
</tr>
<tr>
<td>Signal activity occurs in a seemingly random fashion throughout the grid</td>
<td>No phase relationship exists (i.e. it is probably a wide stereo field)</td>
</tr>
</tbody>
</table>

If a stereo signal is out of phase, it is not mono compatible because it can cancel itself out, either partially or nearly completely, when collapsed to mono.

![In polarity](image1.png) ![Out of polarity](image2.png) ![No polarity](image3.png)

*Figure 9-48: Checking polarity in a stereo signal with the X-Y Plot.*
**PHASE ANALYSIS**

The Phase Analysis window (Figure 9-49 on page 112) graphs frequency versus phase difference versus amplitude of a stereo signal on either rectangular or polar coordinates.

In rectangular coordinates, the vertical axis represents frequency, and the horizontal axis represents the phase of the left channel minus the phase of the right channel (measured in radians).

In polar coordinates, the radius represents frequency and the angle (theta) from the +y vertical axis represents the phase difference of left channel minus the right channel.

**Correlation Meter**

The blue Correlation Meter to the right of the display shows the correlation between the two channels. The higher the meter, the higher the correlation between the two channels.

**Opening the Phase Analysis**

Each 896mk3 interface has its own Phase Analysis window. Choose the Phase Analysis item from the Devices menu under the desired interface.

**Choosing a channel pair to display**

The Phase Analysis window follows the currently focused audio input or output. If you focus a mono channel (e.g. Analog 3), its corresponding stereo pair will be displayed (Analog 3–4).

**View controls**

The View controls (Figure 9-50) provide several options for the Phase Analysis display.

---

**Figure 9-49: Phase Analysis**

**Figure 9-50: View controls**
Pausing the display
The Pause button in the upper right corner of the View section (Figure 9-50) allows you to freeze the display at any time. To resume, click the button again. The correlation meter will remain active while the display is paused.

A/B (stereo audio channels)
The View section (Figure 9-50) displays the pair of input or output audio channels you are viewing. See “Choosing a channel pair to display” above.

Line/Scatter
Choose either Line or Scatter from the menu in the View section (Figure 9-50) to plot each data point as either a single pixel or as a continuous line that connects each frequency data point to the next, as shown below in Figure 9-45.

Figure 9-51: The same Phase Analysis displayed in Line versus Scatter mode.

- Line mode is significantly more CPU intensive than Scatter. You can reduce Line mode CPU overhead for the Phase Analysis display by increasing the Floor filter and reducing the Max Delta Theta filters (see “Filters” on page 114).

Color/Grayscale
In Color mode (Figure 9-50) signal amplitude is indicated by color as follows: red is loud and blue is soft. In grayscale mode, white is loud and gray is soft.

Linear/Logarithmic
Choose either Linear or Logarithmic from the menu in the View section (Figure 9-50) to change the scale of the frequency axis. In rectangular coordinates, the vertical axis represents frequency, and in polar coordinates, the radius from the center is frequency. With a linear scale, frequencies are spaced evenly; in a logarithmic scale, each octave is spaced evenly (frequencies are scaled logarithmically within each octave).

Linear is better for viewing high frequencies; logarithmic is better for viewing low frequencies.

Rectangular/Polar
Choose either Rectangular or Polar from the menu in the View section (Figure 9-50) to control how audio is plotted on the Phase Analysis grid. Rectangular plots the audio on an X-Y grid, with frequency along the vertical axis and phase difference on the horizontal axis. Polar plots the data on a polar grid with zero Hertz at its center. The length of the radius (distance from the center) represents frequency, and the angle (theta) measured from the +y (vertical) axis represents the phase difference in degrees.

Figure 9-52: Rectangular versus Polar display (with a linear plot).

Above, Figure 9-52 shows Rectangular versus Polar display with a Linear plot. Below, Figure 9-53 shows the same displays (and the same data) with a Logarithmic plot:

Figure 9-53: Rectangular versus Polar display with a logarithmic plot.
Axes
The Axes control (Figure 9-50) sets the opacity of the grid displayed in the graph, from 100% (fully visible) down to 0% (fully hidden).

Horizontal and vertical controls
The Horizontal and Vertical controls (Figure 9-54) let you scale each axis of the grid and offset its zero point. Click and drag the values up or down to set them, or double-click to return to the default value.

There are two modes for the controls: Zoom/Offset and Min/Max. To change the mode, use the menu shown in Figure 9-54.

![Figure 9-54: Setting the Horizontal or Vertical control modes.](image)

In Zoom/Offset mode, Zoom scales the axis. Pos moves the zero line.

In Min/Max mode, Min and Max let you scale the grid by moving the end points along the axis. Min/Max mode lets you set the boundaries of the graph directly.

Filters
The Filters section (Figure 9-55) lets you control the density of the Phase Analysis display.

![Figure 9-55: Filters](image)

Floor
Floor (Figure 9-55) determines the amplitude threshold for the display. When the amplitude of both channels drops below this threshold, the signal is not shown.

Max delta theta
Max delta theta (Figure 9-55) only affects Line view (see “Line/Scatter” on page 113) and sets the maximum difference in frequency between plot points in the line plot. For two adjacent frequencies, if the distance (phase difference) between the two frequencies is greater than the Max delta theta, then the line is not drawn.

Using the Phase Analysis
In the polar display (top row of Figure 9-56 on page 115), stereo material that is predominantly phase-aligned (correlated) appears along the vertical axis, as demonstrated in the first column (Perfectly in phase) in Figure 9-56. If the vertical line tilts left or right, this indicates general differences in phase; the more the tilt (delta theta), the more the phase difference. If the vertical line points downwards in the polar display, this indicates that the stereo image is predominantly out of polarity, as demonstrated by the fourth column (Inverted) in Figure 9-56. Delays appear as spirals in the polar display.

The rectangular display (bottom row of Figure 9-56) also shows a predominantly phase-aligned stereo image along the vertical axis, and tilt (or left-right offset) from the center vertical axis represents differences in phase. If a signal is predominantly out of polarity, it appears along the theta = -1.0 or theta = +1.0 lines in the rectangular display, as demonstrated in the fourth column (Inverted) in Figure 9-56 on page 115.

Using Phase Analysis for multiple mic placement
The polar display can be very useful when recording drums or another instrument with multiple microphones. The slight delays caused by the differences in distance to the source can often create a comb filtering (delay) effect between two mic signals, due to phase cancellation. These comb filter effects appear as spirals in the polar display. If you arrange the mics so that the null points (where the spiral pattern meets the negative y axis) are
outside the critical frequency range of the instrument being recorded, you can avoid phase problems among the mic signals.

**Tuning PA systems**
The Phase Analysis window can also be used to troubleshoot and tune PAs and sound reinforcement systems by placing microphones in strategic locations, comparing the two signals in the Phase Analysis grid and looking for phase issues at various locations.

**Summing to mono**
The Phase Analysis window is ideal for checking stereo audio that needs to be summed to mono. The Phase Analysis lets you see what frequencies will be canceled out when summed.

In the rectangular view, any lines in the signal that touch the +1.0 or -1.0 vertical lines in the grid will be canceled out at the frequency where they touch, when the signal is summed to mono.

In the polar view, any signal that falls on the negative y axis (below zero) in polar view will be canceled out when the signal is summed to mono.

**Checking for phase issues in stereo tracks**
You can use the Phase Analysis window to check the overall polarity of a stereo mix. Figure 9-57 is an example of a full stereo mix that has phase issues, as indicated by the majority of the signal’s energy, which is predominantly skewed to the left side of the rectangular view (left) and spread along the -y axis in the polar view (right).

Figure 9-57: A stereo mix with phase issues.

**Figure 9-56: Two identical audio streams in the Phase Analysis.**
TUNER

The Tuner window is an accurate and easy to use tuner.

Opening the Tuner
Each 896mk3 interface has its own Tuner window. Choose the Tuner item from the Devices menu under the desired interface.

Choosing a channel pair to display
The Tuner window follows the currently focused audio input or output. If you focus a mono channel (e.g. Analog 3), its corresponding stereo pair will be displayed (Analog 3–4).

Choosing the channels to tune
The displayed channel pair is shown in the lower left corner. Each channel has a checkbox to enable or disable its input to the tuner.

Tuner controls
Detected frequency: fundamental frequency of the incoming signal, in Hertz (Hz).

Detected note: note name and octave that correspond to the detected fundamental frequency.

Meter: representation of the pitch difference between the detected note and the detected fundamental frequency. The horizontal position of the illuminated segments indicates how far the detected frequency is from the detected note. The number of illuminated segments indicates uncertainty or inharmonicity in the signal; a greater number of illuminated segments represents greater uncertainty. The color of the segments changes gradually from green (in tune) to yellow, orange, and red (progressively further out of tune).

Meter value: difference between the detected note and the detected frequency, in cents.

Arrows: the direction in which the detected frequency needs to move to match the frequency of the detected note. The color of the arrows changes progressively in the same manner as the meter segments. When the detected fundamental frequency matches the detected note within three cents, both arrows will be illuminated.

Reference frequency: sets the frequency reference for the pitch A4, between 400 and 480 Hz. The default frequency is 440 Hz. The reference frequency can be adjusted by dragging on the bar below the number, or by clicking the number and typing a value. To reset the tuner to the default frequency, double-click the slider, or click the number, press the Delete key, and press Enter.

Tuning stereo signals
When tuning a stereo signal, the tuner analyzes the sum of the two channels. If the channels are not phase coherent, the tuner may not be able to measure the frequency of the signal. To tune only one channel of the channel pair, disable one of the channels as described in “Choosing the channels to tune”.

CONFIGURATIONS MENU
A configuration is just like a hardware preset (a "snapshot" of all settings in CueMix FX and therefore the 896mk3 hardware itself), except that it can be created and managed using the CueMix FX software on your computer, completely independently of the 896mk3 hardware. The commands in the Configurations menu let you create, save, load, import, export and otherwise manage as many configurations as you wish.

Here is a summary of Configurations menu operations:

<table>
<thead>
<tr>
<th>Configurations Menu Item</th>
<th>What it does</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create New</td>
<td>Lets you name and save a new configuration, which appears at the bottom of the Configurations menu.</td>
</tr>
<tr>
<td>Save</td>
<td>Overwrites the current configuration (checked in the list at the bottom of the menu) with the current settings in CueMix FX.</td>
</tr>
<tr>
<td>Save To</td>
<td>Same as Save above, except that it lets you first choose the configuration you wish to save to (instead of the current one).</td>
</tr>
<tr>
<td>Delete</td>
<td>Lets you choose a configuration to permanently remove from the menu.</td>
</tr>
<tr>
<td>Import</td>
<td>Loads all configurations from a configuration file on disk.</td>
</tr>
<tr>
<td>Export</td>
<td>Saves all current configurations as a file on disk.</td>
</tr>
<tr>
<td>Configuration list</td>
<td>Choose any configuration to load it. The current (last loaded or saved) configuration has a check mark next to it.</td>
</tr>
</tbody>
</table>

Modifying a configuration
The name of the current configuration is displayed in the CueMix FX window title bar. If you make any changes to the settings in CueMix FX, an asterisk appears in front of the name to remind you that the current state of CueMix FX doesn’t match the saved configuration. If you wish to update the saved configuration with the new changes, use the Save command. To save the current state of CueMix FX to another configuration, choose Save To. To save as a new, separate configuration, choose Create New.

Saving a CueMix FX configuration as a hardware preset
To save a CueMix FX configuration as a hardware preset:

1. Choose the configuration from the Configurations menu to make it the current active configuration.
2. Choose File menu > Save Hardware Preset.
3. Type in a name, choose a preset slot and click OK.

Saving a hardware preset as a CueMix FX configuration
To save a hardware preset as a CueMix FX configuration:

1. Choose File menu > Load Hardware Preset to make it the current active preset.
2. Choose Configuration menu > Create New (or Save To) to save it as a configuration.

TALKBACK MENU
Choose the commands in the Talkback menu to engage or disengage Talkback or Listenback.

PHONES MENU
The Phones menu allows you to choose what you will hear on the headphone output, just like the Phones setting in MOTU Audio Setup. However, this menu provides one extra option that is exclusive to CueMix FX: Follow Active Mix. This menu item, when checked, causes the headphone output to mirror the output of the current mix being viewed in CueMix FX. For example, if you are currently viewing mix bus 3, the headphones will mirror the mix bus 3 output (whatever it is assigned to).
CONTROL SURFACES MENU
CueMix FX can be controlled from an automated control surface such as the Mackie Control™. Use the commands in the Control Surfaces menu to enable and configure this feature.

Application follows control surface
When checked, the Application follows control surface menu command makes the CueMix FX window scroll to the channel you are currently adjusting with the control surface, if the channel is not visible when you begin adjusting it. The same is true for the bus tabs: if you adjust a control in a bus that is not currently being displayed, CueMix FX will jump to the appropriate tab to display the control you are adjusting.

Share surfaces with other applications
When the Share surfaces with other applications menu command is checked, CueMix FX releases the control surface when you switch to another application. This allows you to control your other software with the control surface. Here’s a simple way to understand this mode: the control surface will always control the front-most application. Just bring the desired application to the front (make it the active application), and your control surface will control it. When you’d like to make changes to CueMix FX from the control surface, just bring CueMix FX to the front (make it the active application).

When this menu item is unchecked, your control surface will affect CueMix FX all the time, even when CueMix FX is not the front-most application. In addition, you will not be able to control other host audio software with the control surface at any time (because CueMix FX retains control over it at all times). This mode is useful when you do not need to use the control surface with any other software.

CueMix Control Surfaces
CueMix FX includes support for the following control surface products:

- Mackie Control™
- Mackie HUI™
- Mackie Baby HUI™

Use the sub-menu commands in the CueMix Control Surfaces menu item to turn on and configure control surface support, as described briefly below.

Enabled
Check this menu item to turn on control surface operation of CueMix FX. Uncheck it to turn off control surface support.

Configure…
Choose this menu item to configure your control surface product. Open the help files for specific, detailed instructions on configuring CueMix FX for operation with your control surface product.

Figure 9-58: Refer to the extensive on-line help for details about configuring CueMix FX for operation with your control surface product.
Other HUI-compatible control surfaces
Any control surface that has the ability to emulate a HUI should be compatible with CueMix FX. Just add a Mackie HUI to Audio MIDI Setup and put the control surface hardware into HUI emulation mode. Consult the control surface manual for details about how put it into HUI emulation mode.

Other control surface hardware products
If you install other control surface drivers written for CueMix FX, they will appear as separate menu items at the bottom of the Control Surfaces menu, with the same sub-menu items described above.
CHAPTER 10  MOTU SMPTE Setup

OVERVIEW
The 896mk3 can resolve directly to SMPTE time code via any analog input, without a separate synchronizer. The 896mk3 can also generate time code via its time code output. The 896mk3 provides a DSP-driven phase-lock engine with sophisticated filtering that provides fast lockup times and sub-frame accuracy. Direct time code synchronization is supported by AudioDesk and Digital Performer on Mac OS X. Other hosts, such as Pro Tools, can resolve to MIDI Time Code generated by the 896mk3 Hybrid.

MOTU SMPTE SETUP
The included MOTU SMPTE Setup™ software provides a complete set of tools to generate SMPTE for striping, regenerating or slaving other devices to the computer.

CLOCK/ADDRESS
The Clock/Address menu (Figure 10-1) provides the same global Clock Source setting as in MOTU Audio Setup (“Clock Source” on page 43), but it includes additional information: each setting shows both the clock and the address (time code or sample location), separated by a forward slash (/).

To resolve the 896mk3 to SMPTE time code, choose the SMPTE / SMPTE setting in the Clock/Address menu. This means that the system will use SMPTE as the clock (time base) and SMPTE as the address.

FRAME RATE
This setting should be made to match the SMPTE time code frame rate of the time code that the system will be receiving. The 896mk3 can auto-
detect and switch to the incoming frame rate, except that it cannot distinguish between 30 fps and 29.97 fps time code, or 23.976 and 24 fps time code. So if you are working with either of these rates, make sure you choose the correct rate from this menu. The 896mk3 driver updates the frame rate setting in Digital Performer and AudioDesk for you.

**READER SECTION**

The Reader section (on the left-hand side of the window in Figure 10-1) provides settings for synchronizing the 896mk3 to SMPTE time code.

**Status lights**

The four status lights (Tach, Clock, Address and Freewheel) give you feedback as follows.

**Tach**

The Tach light blinks once per second when the 896mk3 has successfully achieved lockup to SMPTE time code and SMPTE frame locations are being read.

**Clock**

The Clock light glows continuously when the 896mk3 has successfully achieved lockup to an external time base, such as SMPTE time code or the optical input.

**Address**

The Address light glows continuously when the 896mk3 has successfully achieved lockup to SMPTE time code.

**Frewheel**

The Freewheel light illuminates when the 896mk3 is freewheeling address (time code), clock or both. For details about Freewheeling, see “Freewheel Address” and “Freewheel clock” below.

**SMPTE source**

Choose the analog input that is connected to the time code source. This is the input that the 896mk3 “listens” to for time code.

**Freewheel Address**

Freewheeling occurs when there is a glitch or drop-out in the incoming time code for some reason. The 896mk3 can freewheel past the drop-out and then resume lockup again as soon as it receives readable time code. Choose the amount of time you would like the 896mk3 to freewheel before it gives up and stops altogether.

The 896mk3 cannot freewheel address without clock. Therefore, the Freewheel Address setting will always be lower than or equal to the Freewheel Clock setting, and both menus will update as needed, depending on what you choose.

Keep in mind that freewheeling causes the system to keep going for as long as the duration you choose from this menu, even when you stop time code intentionally. Therefore, if you are starting and stopping time code frequently (such as from the transports of a video deck), shorter freewheel times are better. On the other hand, if you are doing a one-pass transfer from tape that has bad time code, longer freewheel times will help you get past the problems in the time code.

**The ‘Infinite’ freewheel setting**

The Infinite freewheel setting in the Freewheel Address menu causes the 896mk3 to freewheel indefinitely, until it receives readable time code again. To make it stop, click the Stop Freewheeling button.

**Freewheel clock**

Freewheeling occurs when there is glitch or drop-out in the incoming SMPTE time code for some reason. The 896mk3 can freewheel past the drop-out and then resume lockup again as soon as it receives a stable, readable clock signal.
The 896mk3 cannot freewheel address without clock. Therefore, the Freewheel Address setting will always be lower than or equal to the Freewheel Clock setting, and both menus will update as needed, depending on what you choose.

**The 'Infinite' freewheel setting**
The Infinite freewheel setting in the Freewheel Clock menu causes the 896mk3 to freewheel indefinitely, until it receives readable time code again. To make it stop, click the Stop Freewheeling button.

**Stop Freewheeling**
The Stop Freewheeling button stops the system if it is currently freewheeling.

**GENERATOR SECTION**
The Generator section (on the right-hand side of the window in Figure 10-1) provides settings for generating SMPTE time code.

**Level**
Turn the level knob to adjust the volume of the SMPTE time code being generated by the 896mk3. The level knob disappears when the Destination is set to None.

**Tach light**
The Tach light blinks once per second when the 896mk3 is generating SMPTE time code.

**Destination**
In the Destination menu, choose either SMPTE (to generate time code) or None (to turn it off).

**Stripe**
Click this button to start or stop time code. To set the start time, click directly on the SMPTE time code display in the Generator section and type in the desired start time. Or drag vertically on the numbers.

**Regenerate**
This option, when enabled, causes the generator to generate time code whenever the 896mk3 is receiving SMPTE time code.

**Generate from sequencer**
This option, when enabled, causes the generator to generate time code whenever you are running AudioDesk or Digital Performer. Time code begins at the time specified by the AudioDesk or Digital Performer main transport.

**SETTING UP FOR SMPTE TIME CODE SYNC**
To set up direct SMPTE time code synchronization, see “Syncing to SMPTE time code” on page 34.

**RESOLVING DP OR AUDIODESK TO TIME CODE**
To resolve Digital Performer or AudioDesk directly to time code with no additional sync devices, use the setup shown in “Syncing to SMPTE time code” on page 34. Choose Receive Sync from the Setup menu and choose the Sample accurate option. Make sure that the Slave to External Sync command in the Studio menu is checked. Make sure the Clock Source setting in the MOTU Audio Setup window is set to SMPTE. Also, make sure that you've connected an LTC input signal to the 896mk3 time code input, and that you've specified that input in SMPTE Source menu in SMPTE Setup.
RESOLVING PRO TOOLS TO TIME CODE
To resolve your Pro Tools system directly to SMPTE time code with no additional synchronization devices, use the setup shown in “Syncing to SMPTE time code” on page 34.

1 Connect an LTC signal to the 896mk3 time code input (or other analog input).
2 In MOTU SMPTE Setup, go to the SMPTE Source menu and choose the SMPTE input (or other analog input that is receiving the time code).
3 In MOTU SMPTE Setup, go to the Clock Source menu and choose SMPTE/SMPTE as the clock source.
4 Make the other settings in MOTU SMPTE Setup as desired. Refer to their sections in this chapter for more information.
5 In Pro Tools, choose Peripherals from the Setup menu and click the Synchronization tab.
6 Choose the 896mk3 Hybrid Sync Port from the MTC Reader Port menu.

RESOLVING OTHER HOSTS TO TIME CODE
The 896mk3 Hybrid has the ability to convert incoming SMPTE time code (LTC) to MIDI Time Code and send it to your host audio software, which can resolve to it. To do so, use the setup shown in “Syncing to SMPTE time code” on page 34. Here is the basic procedure:

1 Connect an LTC signal to the 896mk3 time code input (or other analog input).
2 In MOTU SMPTE Setup, go to the SMPTE Source menu and choose the SMPTE input (or other analog input that is receiving the time code).
3 In MOTU SMPTE Setup, go to the Clock Source menu and choose SMPTE/SMPTE as the clock source.
4 Make the other settings in SMPTE Setup as desired. Refer to their sections in this chapter for more information.
5 In your host audio software, make the necessary settings for resolving it to MIDI Time Code. Refer to your host audio software documentation for further information. The 896mk3 Hybrid driver provides a separate MIDI Sync Port for the time code, so when you specify the MIDI port to follow, be sure to choose the Sync Port.
Part 3
Appendices
APPENDIX A  Audio I/O reference

OVERVIEW
The MOTU Audio drivers supply text string labels for the 896mk3’s audio inputs and outputs to clearly identify each one, but some applications do not display these labels.

The following sections show how you can identify each input and output in a numbered list like this.

MAC OS X: CORE AUDIO
Channels appear in the following order for Core Audio applications on Mac OS X.

Inputs at 1x sample rates
Inputs are always listed in the same order as follows, when operating the 896mk3 at 1x sample rates (44.1 or 48 kHz):

### Outputs at 1x sample rates

Outputs are always listed in the same order as follows, when operating the 896mk3 at 1x sample rates (44.1 or 48 kHz):

<table>
<thead>
<tr>
<th>Output 1-2 kHz Channels</th>
<th>List position</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main outs 2</td>

<td></td>
</tr>
<tr>
<td>Optical B 8 ADAT 2 TOSLINK</td>
<td>25-32 19-20</td>
<td></td>
</tr>
</tbody>
</table>

These channel number ranges assume that optical A is operating with the same format.

### Outputs at 2x sample rates

When operating the 896mk3 at a 2x sample rate (88.2 or 96 kHz), outputs are listed as follows:

APPENDIX B  Troubleshooting

Slaving directly to time code in AudioDesk or Digital Performer
To slave Digital Performer or AudioDesk directly to time code, be sure to go to the Receive Sync dialog in Digital Performer or AudioDesk and switch from “MTC” to “Sample-accurate.”

Can’t authenticate AudioDesk
When authenticating AudioDesk, the OK button does not become active until you have entered in your name and a valid keycode. Your name must contain at least three characters, and you must enter the keycode exactly as it appears (on the jacket of your AudioDesk installer disc). If you continue to have difficulties, try repairing Mac OS X disk permissions using Disk Utility.

Clicks and pops under word clock sync
Many problems result from incorrect wordclocking. It is essential that all digital devices in the system be word locked. Consult “Making sync connections” on page 28 for detailed information on how to word clock your gear. Whenever there is any weird noise or distortion, suspect incorrect word lock.

Clicks and pops due to hard drive problems
If you have checked your clock settings and you are still getting clicks and pops in your audio, you may have a drive related problem. Set your Clock Source to Internal and try recording just using the analog inputs and outputs of the 896mk3. If you encounter the same artifacts you may want try using another drive in your computer. Clicks and pops can also occur when the drive is severely fragmented or there are other drive-related issues. If you are using a FireWire drive on the same bus as the 896mk3, it could be that the FireWire bus is overloaded (too many devices on the same bus). Try removing all devices except the 896mk3.

Connecting or powering gear during operation
It is not recommended that you connect/disconnect, or power on/off devices connected to the 896mk3 while recording or playing back audio. Doing so may cause a brief glitch in the audio.

896mk3 inputs and outputs are not available in host audio software
Make sure that the inputs and outputs are enabled. See “Working with 896mk3 inputs and outputs” on page 63.

No optical inputs or outputs are available in host audio application
Check to make sure you have the desired optical inputs and/or outputs enabled in the MOTU Audio Setup.

Monitoring - How to monitor inputs?
Please refer to the documentation for the audio application that you are using. If your application does not support input monitoring, you will need to use the 896mk3’s hardware-based CueMix FX monitoring feature. Please see chapter 8, “Reducing Monitoring Latency” (page 67).

Controlling monitoring latency
See chapter 8, “Reducing Monitoring Latency” (page 67).

CUSTOMER SUPPORT
We are happy to provide customer support to our registered users. If you haven’t already done so, please take a moment to register online at MOTU.com, or fill out and mail the included registration card. Doing so entitles you to technical support and notices about new products and software updates.
REPLACING DISCS
If your installer disc becomes damaged, our Customer Support Department will be glad to replace it. You can request a replacement disc by calling our business office at (617) 576-2760 and asking for the customer service department. In the meantime, you can download the latest drivers from www.motu.com.

TECHNICAL SUPPORT
If you are unable, with your dealer’s help, to solve problems you encounter with the 896mk3 system, you may contact our technical support department in one of the following ways:

- Tech support hotline: (617) 576-3066 (Monday through Friday, 9 a.m. to 6 p.m. EST)
- Online support: www.motu.com/support

Please provide the following information to help us solve your problem as quickly as possible:

- The serial number of the 896mk3 system. This is printed on a label placed on the bottom of the 896mk3 rack unit. You must be able to supply this number to receive technical support.
- A brief explanation of the problem, including the exact sequence of actions which cause it, and the contents of any error messages which appear on the screen.
- The pages in the manual which refer to the parts of the 896mk3 or AudioDesk with which you are having trouble.
- The version of your computer’s operating system.

We’re not able to solve every problem immediately, but a quick call to us may yield a suggestion for a problem which you might otherwise spend hours trying to track down.

If you have features or ideas you would like to see implemented, we’d like to hear from you. Please write to the 896mk3 Development Team, MOTU Inc., 1280 Massachusetts Avenue, Cambridge, MA 02138 or send an email to: customerservice@motu.com.
